List of Figures

1.1 Phase diagram of the XXZ spin chain in a magnetic field \( h \) at zero temperature and with \( J = 1 \). .......................... 12

2.1 Combinations of quantum numbers corresponding to the ground state and several excited states (see text for description) in the \( N = 16 \) spin chain. .......................... 28

2.2 For \( N = 128, M = 64 \), we show in (a) the DesCloizeaux-Pearson spectrum of 1 spinon and in (b), (c), (d) the densities of states corresponding of states containing 2,4 and 6 spinons. The \( \ldots \) represents any additional static quasiparticle like \( \infty, 1s^2, 1s^3 \) which does not contribute to the density of states. .......................... 29

2.3 For \( N = 128, M = 16 \), we present (a) the artificial spectra of 1h, 1p and 1s^2 and (b),(c),(d),(e),(f) are the densities of states corresponding to the type of excitation mentioned in the label. .......................... 30

2.4 For \( N = 128, M = 32 \), we present (a) the artificial spectra of 1h, 1p and 1s^2 and (b),(c),(d),(e),(f) are the densities of states corresponding to the type of excitation mentioned in the label. .......................... 31

2.5 For \( N = 128, M = 48 \), we present (a) the artificial spectra of 1h, 1p and 1s^2 and (b),(c),(d),(e),(f) are the densities of states corresponding to the type of excitation mentioned in the label. .......................... 33

4.1 Experimental setup of time-of-flight spectroscopy. .................. 48

4.2 This sketch outlines the 1D magnetic active part of Sr\(_2\)CuO\(_3\). We show here a layer of the crystal and in the bulk, each chain is isolated from the layers above and below by Strontium atoms. .................. 51

4.3 Mechanism by which double-spin flip transitions are created in the indirect magnetic RIXS process. .......................... 52

5.1 \( S^{--+}(q,\omega) \) DSF in a \( N = 400 \) XXX spin chain and (a) \( M = 50 \), (b) 100, (c) 150 and (d) 200. .......................... 65
5.2 Separated graphs of the $S^{--++}(q,\omega)$ DSF for the three main types of excitation with $N = 400$ and $M = 150$. The type of excitation plotted is specified in the label and is described and explained in section 2.8. ........................................... 66

5.3 Contributions by type of excitation to the $S^{--++}(q,\omega)$ DSF for $N = 400$ and $M = 200$. The graphs are labeled by the type of excitations that are represented. ........................................... 67

5.4 $S^{zz}_{z}(q,\omega)$ DSF for a $N = 400$ XXX spin chain and (a) $M = 50$, (b) 100, (c) 150 and (d) 200 ........................................... 75

5.5 Separated figures of the $S^{zz}_{z}(q,\omega)$ DSF with $N = 400$ corresponding to types of excitation in the labels. The magnetization is $M = 150$ in (a), (b) and (c) and $M = 200$ for (d) and (e) ........................................... 77

6.1 (a) Spin-exchange DSF $S^{\text{exch}}_{z}(q,\omega)$ and (b) single spin DSF $S^{zz}_{z}(q,\omega)$ for $N = 400$ sites in $h = 0$. The intensity around $q = \pi$ is markedly different in the two cases and the signal of the spin-exchange DSF around $q = \frac{\pi}{2}, \frac{3\pi}{2}$ is enhanced. ........................................... 85

6.2 Fixed momentum profiles of the biased spin-exchange DSF $S^{\text{exch}}_{z}(q,\omega)/(\cos^2(q/2))$ (plain) and $S^{zz}_{z}(q,\omega)$ (dashed), each normalized to its own sum rule. 86
