Peer review is a crucial component of modern science. The
fact that L&O is able to utilize the services of the best scientists
as reviewers allows it to be a leading journal in the aquatic
sciences. However, these individuals seldom get the recognition
they deserve for this selfless work. Therefore, each issue of the
Bulletin will cite outstanding reviewers that Everett Fee, L&O
Editor, feels deserve special recognition for their overall review-
ing efforts. The ASLO membership extends its sincerest appre-
ciation and thanks these two outstanding scientist(s).

WILLIAM R. DEMOTT
Bill DeMott is a professor in the
Department of Biology at Indiana-Purdue
University. He does research on the
pelagic food chains of lakes with a focus on
mechanisms of food limitation in zooplank-
ton. He is a member of the editorial boards
of Freshwater Biology and Aquatic Ecology,
has served terms as a subject matter editor for Ecology and as an
editor for Fundamental and Applied Limnology, and has been an ad
hoc reviewer for at least 31 scientific journals.

HANS-PETER GROSSART
Hans-Peter Grossart is a scientist at the
Department of Limnology of Stratified
Lakes, Leibniz Institute of Freshwater
Ecology and Inland Fisheries (IGB-Berlin)
where he is leading the research section for
“Aquatic Biodiversity” and the “Aquatic
Microbial Ecology” group. His research
interests are broadly in marine and freshwater ecology, focusing
on biogeochemical processes such as C-cycling and Poly-P
storage in the pelagic zone and sediments, interactions between
calculus and other organisms, diversity and function of aquatic
microorganisms, and aggregation processes. At present, his group is
investigating diversity, evolution, and ecological functions of pelagic
freshwater bacteria, in particular Actinobacteria of the Ac groups,
in a variety of different lakes but also in the Baltic Sea. Other
research topics include microbial humic matter degradation, fungal
ecology, photolysis of microbial substrates, ocean acidification,
and temperature dependent changes. His group combines traditional
microbiological methods with molecular methods and chemical
analytics to unravel the fascinating mystery of aquatic microbes at
the microscale of specific aquatic habitats up to the global scale.

BOOK REVIEWS
THOMAS KIØRBOE. 2008. A Mechanistic Approach to
Reviewed by Jef Huisman, Aquatic Microbiology, Institute for

Kiørboe’s book offers an exciting tour through biological-physical
interactions in the plankton. The book successfully demonstrates
how basic knowledge of small-scale physical and chemical pro-
cesses contributes to a better understanding of plankton ecology at
the individual level. Expanding on these individual-level processes,
the book produces new insights in community dynamics, and the
structure and functioning of pelagic food webs. It is an outstanding
overview of ongoing research on plankton encounter rates, and
will be highly suitable for seminars and advanced student courses.
The first chapters present an invitation to think about notions at the core of plankton ecology. Kiørboe leads the reader through a variety of ideas and fundamental questions to develop an intuitive understanding of the everyday life of individual plankters. At the individual level, the life of planktonic organisms is all about encounters. They have to find food, they have to find mates, and they should stay away from predators. These might seem simple and familiar tasks. After all, human beings also enjoy a good dinner, like to find a good mate, and prefer to avoid any undesired encounters. Yet imagine yourself as a tiny little plankter in the middle of the endless ocean, mostly blind-folded. The surrounding fluid is three-dimensional, concentrations of food are extremely low, and the nearest mate can be thousands of body lengths away. In addition, the surrounding fluid feels like dense syrup as the viscosity of water dominates over inertial forces at these small scales. Swimming is demanding. Got the picture? How are you ever going to arrive at dinner in time, let alone find yourself a suitable mate in this unstructured, viscous and vast environment? The ocean environment as experienced from the perspective of a small plankter isn’t quite the same as our own world after all.

Natural selection has favored a multitude of adaptations in the individual behavior, morphology, and ecology of planktonic organisms to cope with these challenges. Take the copepods, which make up about 80% of the mesozooplankton in the oceans. As nicely illustrated on the front cover of the book, copepods have two huge antennules packed with sensory hairs sticking out in the water, aimed at chemical and hydromechanical signals in the environment. They put this sensory machinery into use to explore their surroundings. For instance, female copepods can leave a long trail of pheromones behind as they slowly swim through the endless ocean. Male copepods crossing this trail pick up the scent, and track the convoluted trail. During tracking, the male constantly checks the borders of the trail by chemoreceptive sensors on its antennules, and adjusts its chase accordingly, until he finally makes it to the female. Kiørboe discusses these spectacular stories in a very lucid style, and then moves on to derive equations that allow a quantitative evaluation of the implications. For instance, based on simple calculus, he shows that pheromone tracking increases the encounter rates of males and females substantially. Girls shouldn’t leave without a trace.

These analyses point to the issue of spatial scale. Do we observe plankton dynamics at scales relevant to the organisms? Much of our knowledge of aquatic ecosystems is based on “blind sampling,” where we simply scoop up a few liters of water, several meters apart along the vertical, and enumerate the organisms in our samples. However, these coarse methods only sample bulk properties of aquatic ecosystems. Kiørboe argues, convincingly, that these sampling methods exceed the spatial scale of individual plankters by orders of magnitude. The whole book builds up on this logic. It starts from descriptions of the spatial and temporal scales at which chemical signals and food particles are dispersed by diffusion and advection, and shows how these important transport processes affect the feeding rates and motility of individual organisms. Subsequently, Kiørboe discusses the emergence of global properties at larger scales, extrapolating the individual-based processes from preceding chapters to the population level. For instance, according to the coagulation theory developed with his colleague George Jackson, encounters between sticky particles can ultimately lead to the formation of large aggregates in the form of marine snow. Such aggregate formation has important implications for the dynamics of phytoplankton populations, which suffer large sedimentation losses by coagulation, and for the downward flux of organic carbon from surface waters into the deep ocean. Finally, in the last chapter of the book, the individual- and population-level processes are integrated to gain a more comprehensive understanding of the dynamics of entire pelagic food webs.

Emphasis is clearly set on processes at the organism scale. Hence, the chapters on community processes and ecosystem dynamics are relatively brief, and the book does not cover all aspects of plankton ecology. In particular, the title of the book may suggest that it covers mechanistic approaches to competition theory, which is textbook material in many undergraduate ecology courses, and has been extensively tested in plankton competition studies (e.g., papers by Tilman, Sommer, Grover, Rothhaupt, Lampert, and several others). However, although the book contains many useful references to competition studies, the book does not review resource competition theory, and also doesn’t tackle several other hot topics in plankton ecology such as ecological stoichiometry, inducible defenses, biogeochemical processes, and regime shifts in aquatic ecosystems. The book is more limited in scope than the title suggests. Clearly, dealing with all these topics would have been a tremendous task, and would have diluted the original message of the book in a mass of information. The book may thus present a starting point for plankton ecologists, to inspire further research linking the small-scale physical processes that are so important in the everyday life of the plankton with other important themes in plankton ecology. The intended audience of the book consists of graduate students and postdocs as well as senior researchers. Some understanding of biological oceanography and/or aquatic ecology, at the undergraduate level, is recommended. Many of the conceptual ideas build on earlier books on physical-biological interactions by Denny (1993), Berg (1993), and Vogel (1994). However, none of these earlier books focused specifically on the plankton. The author makes extensive use of simple fluid dynamics and diffusion theory to understand and evaluate the adaptations of planktonic organisms to their physical and chemical surroundings. Hence, mathematical equations are presented throughout the book. Yet, the math never becomes really complicated. A basic knowledge of high school calculus is required, and is often (but not always) sufficient to follow the arguments. It is clear from the careful explanations that much of the material has been developed as teaching material for courses. The writing style is very pleasant and reveals a passionate author, who offers his thoughts, and shares his experience, in a very didactic synthesis. Last but not least, the book is affordable (only US$ 39.50!). If you are interested in the state of the art on life at the scale of the individual plankter, then this book is definitely something for you!

Known for his seminal work on the functional response and resilience, C.S. Holling in 1992 published a paper (Holling 1992) that would again stir up the field of ecology. He showed that the distribution of body size in ecological communities might not follow the classical smooth power-law, but rather show a puzzling regular pattern of ‘lumps’ and ‘gaps.’ Analyzing data from birds and mammals he found that there were groups of species of roughly the same size (the lumps), whereas other sizes in the possible range were conspicuously missing (the gaps). While there was initial doubt about the statistical significance of the lumpy patterns, later studies in terrestrial but also in aquatic communities (e.g. Havlicek and Carpenter 2001) suggest that the lumpiness might actually be a quite common feature of size distributions.

Clearly, this pattern is fascinating as (unlike standard distributions) it might hint at underlying mechanisms that shape communities. The overall explanation suggested by the editors is introduced in the very first sentence of Chapter 1: “We describe communities. The overall explanation suggested by the editors is...” Rather than the classical smooth power-law, other explanations have been put forward to explain the distribution of body size in ecological communities. These explanations include the evolutionary emergence of groups of similar species, the evolutionary emergence of groups of similar species, the evolutionary emergence of groups of similar species, the evolutionary emergence of groups of similar species, the evolutionary emergence of groups of similar species. These explanations include the evolutionary emergence of groups of similar species, the evolutionary emergence of groups of similar species, the evolutionary emergence of groups of similar species, the evolutionary emergence of groups of similar species, the evolutionary emergence of groups of similar species. These explanations include the evolutionary emergence of groups of similar species, the evolutionary emergence of groups of similar species, the evolutionary emergence of groups of similar species, the evolutionary emergence of groups of similar species, the evolutionary emergence of groups of similar species.

In summary, the book introduces the reader to a field in which there are puzzling patterns but no consensus on their explanation. Aren’t such fields of work the best places to be?
