Acknowledgments

The realization of this thesis has by no means been the product of a one man show, but rather that of an orchestrated effort in which supervisors, colleagues, friends and family all have played an important role and to whom I owe a great debt of gratitude.

Firstly, I would like to thank Reinier for giving me this opportunity and providing me with a plethora of ideas and new leads whenever a line of experiments led to a dead end. Your knowledge and enthusiasm for research and ophthalmology have served as an inspiration to me.

Ron, I can't begin to tell you how grateful I am that you took our group under your protective wing. Your practical approach, constructive criticism and insightful advice have been the grease which has kept the wheels of this thesis turning. Thank you for not giving up on myself or this thesis.

In the years I have spent on this thesis I have had the good fortune to be surrounded by colleagues of the highest caliber and from whom I have learned so much about science, ophthalmology and life in general.

Dearest Ingeborg, you have played every bit as an important role in the realization of this thesis as the two esteemed gentlemen mentioned above (in fact maybe even more so!). Without your knowledge, drive and determination I’m certain the contents of this thesis would have been of a much lesser caliber. I am very honored to be the first Ph.D. candidate to have you as a co-promotor. I will also not soon forget the good times we’ve had over the years especially during ARVO and our trip to Northern Ireland.

When facing a great challenge it is always important to have someone with whom you can share the ups and the downs inherent to the endeavor. Esther, I couldn’t have asked for a better compatriot than you. Your ability to critically discuss the latest literature, share in the joy of a successful experiment, or empathize after a failed experiment helped me keep my sanity along the way. While these qualities made you an ideal colleague, they have also served as the basis for a wonderful friendship. I also would like to especially thank you for coming up with an ingenious way of making Rogier extend his stay at the AMC.

Rogier! The one true Big Guy! The yang to Esther’s ying. I know your not one for cheesy sentiment, but your friendship has added and continues to add a healthy dose of comedic relief and levity to the mix. Our experience together as the world’s largest living lab rats was one I’ll never forget. In fact I’m reminded of it every time I have a meatball and a banana for breakfast. From Ali-G to the x-box, it’s always a good time and I look forward to keeping the good times rolling as we once again become colleagues when I start my ophthalmology residency at the AMC in January.

Dearest Ilse, I can’t put into words how grateful I am for all of the hard work you’ve put into my thesis over the years, maintaining cell lines and setting up countless in vitro experiments as well as the hours behind the cryostat en microscope. What I have valued even more about your presence is your listening ear. No matter how busy you are you’ve always taken the time to listen to how life was going with a sympathetic ear.
I hope you won’t mind if I continue to take advantage of this during my residency at the AMC as I look forward to dropping by the lab for a cup of tea and a pleasant chat from time to time.

Antonella: from the start you made me feel welcome and showed me the ropes at the IOI. You taught me everything I needed to know about the cryostat, staining slide after slide of retinal serial sections, and the copy/paste functions on my computer. Your easy going attitude combined with your hunger for knowledge and dedication showed me that it was possible to get a Ph.D. and have fun doing it.

Mariella and Jaipei, although it’s been long ago, I’ve not forgotten your contributions to my work and how you both made me feel welcome in my new surroundings at the IOI.

Rob, John C. and Martin: though the three of you came to the ocular angiogenesis group while I was on my “sabbatical,” I can’t help but feel that we are brothers in arms, experiencing the same trials and tribulations that go hand in hand with research. In my return to the lab these last few months I’ve enjoyed getting to know you all better and I am very pleased that we will continue to be colleagues as ophthalmology residents in the AMC.

I would further like to thank all of my co-authors and collaborators who have been kind enough to perform experiments, provide materials, or teach me the techniques that were invaluable to the creation of this thesis. I would like to especially acknowledge Dr. Tom Gardiner and Dr. Alan Stitt from the Queen’s University of Belfast for inviting Ingeborg and myself to their laboratory and sharing with us their methods for retinal cell culturing and trypsin digests.

When first starting my Ph.D. with the Ocular Angiogenesis group, we were a research group without a lab. Though we were kindly allowed to use the facilities of the IOI, this was not always easy. Fortunately, the staff and fellow researchers were always very kind and helpful, and for this I am grateful. I would particularly like to acknowledge the technical assistance I received from Ben, Jan, Linda and Willem Kamphuis. I would also like to thank Luuk, Joris, Colleen, Iris, Xiaofeng, Albena, Bob, Sridhara, Martijn, Inge, Sancho, Alexander, Serge, Matt B., Matt S. en Damien for their kindness, friendship and good times. Lastly, but certainly not least, I would like Frederike whose friendship has persevered through my long and tumultuous existence as a Ph.D. student. As your paranimf you gave me my first taste of what it is to stand on that podium before the members of the Ph.D. commission. Your deft defense serves as an excellent example to me of how it should be done.

While moving locations halfway through a Ph.D. is not without its difficulties it does bring with it the added benefit of even more wonderful colleagues, friends and acquaintances. Though in the beginning we felt like fish out of water at the department of cell biology, the staff and our new colleagues made us feel very much at home. Of the staff I would especially like Jan Wormeester for his technical assistance and his jovial nature and Trees for her invaluable help with the preparation of many of the manuscripts found in this thesis. I would also like to thank Eric, Hilde, Judith, Marcel,
Dieneke, en Jan Stap for the “gezellig” work atmosphere in (and out of) the lab. It was a real pleasure working beside you all. David, Przemek and Tony: in you I found three friends who are always up for a beer (or a kangaroo burger) and a movie and more often than not another beer (or two, OK maybe one more…). This may not seem like a big deal, but these little escapes from reality were so often exactly what I needed to stay focused and keep me going. Thanks a lot guys. I’m looking forward to many more film nights in the years to come. Sean, Nicolas, Remko en Lennert; my brothers in rock! I met you guys in the halls of science and medicine, but I had the pleasure of getting to know you in the practice rooms of the Melodyline, and on the stages of the Winston, P60 and the Melkweg. It was an amazing experience, one which I will never forget. Rock on!

To my co-promotor professor Mourits and my future colleagues at the department of Ophthalmology in the AMC, I would like to express my gratitude for giving me the opportunity to further my career in the field of ophthalmology. I look forward to getting to know you all better in the coming years of my residency.

I would not be where I am today if not for the love and support of my family. Dad, though this book is dedicated in loving memory to Mom, you have played every bit as an important role in its creation. You have always been the example by which I lead my life. The unconditional love and support you and Mom have given me form the basis for everything I achieve. Ik wil ook dit gelegenheid gebruiken om mijn schoonfamilie bedanken. Rini, Ari en Bas, zonder jullie bereidheid om zo vaak in de weekenden op Finn te passen, was het mij nooit gelukt om mijn boekje af te schrijven!

Lastly and most importantly I would like to thank my wife. Dearest Eva, from the very first moment I chose to pursue my Ph.D. you stood behind my decision. While obtaining a Ph.D. alone can be a formidable test of a relationship, in the course of my Ph.D. we’ve also managed to survive 3 moves, 2 renovations, the loss of both my grandfather and mother, medical school, my aspirations of rock & roll stardom and even parenthood (!). Throughout all of this your love and support have never wavered. You possess a patience and strength that few can match. For this and especially for the gift of our son Finn, I will always be thankful.
