ACKNOWLEDGEMENTS

In a developed country, research is needed to achieve the national goals and expectations. Therefore, several alternatives are normally available to encourage the different kinds of investigations. In contrast, in a developing country, the execution and advancement of research is a difficult task. In a country from the Third World, research is never a priority. In addition, this same research may even challenge the structure of dependency that such countries have on other nations. Consequently, plenty of barriers and a lack of stimuli and support have characterized my career. For this reason, I would like to thank the people who helped me to overcome many of these difficulties and to advance in my research.

First of all, I am profoundly indebted to my wife, Elisa Estenssoro. She was and is my partner, my coworker, and my guide in both life and science.

Furthermore, I am proud of my son Mariano because of his qualities as a human being and have benefitted greatly from his support and fellowship.

I am grateful to my parents, Fanny and Abraham, who gave me everything and focussed my life and my career.

My adopted daughters, Mariana and Laura, who brought further happiness to my life, have been a source of great support.

I have been fortunate to have a friend like Guillermo Gutierrez, through whom I learned to think differently and who has given me his friendship for more than twenty years.

I want to thank my friend Can for changing my life by getting me into the marvellous world of microcirculation. He is, moreover, almost completely responsible for the existence of this Thesis. In addition, I value greatly his friendship.

I also want to thank the different members of the sheep team who, over time, allowed me the development of my research: Carlos Siva, Gladys Calvo, Héctor Canales, Gastón Murias, Juan Pablo Sottile, Julio Badie, Marcelo Barán, Mercedes Laporte, Mario Pozo, Enrique Piacentini, Graciela Etcheverry, Vanina Siham Kanoore Edul, Gonzalo Ferrara, Carlos Canullán, and Enrique Martins.
