ACKNOWLEDGEMENTS
ACKNOWLEDGEMENTS

Hereby I would like to thank everyone who has contributed to this thesis in one way or the other. As the research described in this thesis is quite multidisciplinary, this acknowledgements section could be almost as lengthy as the thesis itself. However, I will try to confine it to two pages, although this might be disproportional to my appreciation.

First, I would greatly like to thank my professor, hocam, and sensei Can Ince. Can, besides being my promoter, you have also been the main source of my inspiration and motivation that eventually led to the production of this thesis. Your endless knowledge and enthusiasm not only made me a better scientist, but also made me a better man. Every morning, sometimes with and sometimes without croissants (as we are both fighting the law of the conservation of mass), we have spent discussing science, philosophies, and brilliant anecdotes. During my research I came to realize that there is no such thing as a perfect professor nor is there anything like a perfect student, but I do think that we made a perfect match. You have taught me the power of “parking (my) thoughts,” the “baklava approach,” “trust is good, control is better,” and “no finance, no romance.” Needless to say, this work, and me becoming a PhD, would not have been possible without you.

Second, I would like to thank my co-promoter and very good friend Michal Heger. Michal, it is undoubtedly so that my hunger for research and publications (as well as my unstoppable hunger for wine and cheese) was triggered by you and your great scientific ambitions. It all began during the exhausting yet very exciting times in Lille staring at the photocoagulation of blood in hamster dorsal skin fold venules. As our physical fitness deteriorated each week due to the insane working hours, our friendship grew. Back in Amsterdam, you supervised the writing of my very first manuscript, which turned out to be an arduous task, and introduced me to Can, who later offered me a position in his department. Although you have been a constant factor in my research, I hope that our collaborations will become even more intense in the future and that perhaps one day, we can pay Stockholm a visit together (as we have done many times in our imagination).

Third, I would like to thank Peter Goedhart. Peter, you made sure that a young, ambitious, but rather unfocused scientist like me could keep his head above the water at Can’s somewhat chaotic department. You showed me the whereabouts in the AMC and taught me the shortcuts in its bureaucracy. Your humor and slightly unorthodox style has made it a pleasure working with you and I am honored to have our paper on SDF imaging as the first chapter of this thesis. You passed away much too soon and left great emptiness in both our department and in our hearts and I therefore dedicate this thesis to you. May you rest in peace.
Furthermore, I would like to thank my colleagues from the Department of Translational Physiology: Otto Eerbeek, Dan Milstein, Emre Almac, Koray Yürük, and Bas Bartels. I am proud to be part of such a multi-disciplinary team that covers a wide spectrum of physiological studies ranging from heart and skeletal muscle physiology (Otto) to wound healing in maxillofacial surgery (Dan), renal oxygenation during hemorrhage, endotoxemia, and resuscitation (Emre), and the peripheral microcirculation during hypovolemia, anemia, and blood transfusion (Koray and Bas). Special thanks go to the fellows from abroad: Matthieu Le Grand and Matthieu le Dorze from Paris, Gianmarco Balestra from Basel, and Alex Dyson from London. I would also like to thank the students that supported our research: Floris Wallis de Vries, Matthijs Radder and Jilles Kramer. Your devotion and loyalty has been very impressive and well-appreciated. You guys made working at our group both interesting and fun.

Then I would like to thank my colleagues from the Intensive Care of the Erasmus Medical Center, and especially Alex Lima, Eva Klijn, and Michel van Genderen, for the constructive discussions on the physician’s point of view with respect to the technological limitations of available and novel modalities for clinical assessment of the microcirculation. Your feedback has been the driving force for the work described in the first half of this thesis.

Great gratitude goes to my colleagues from the Department of Biomedical Engineering and Physics and especially to Iwan Dobbe and Dirk Faber. Iwan, you have definitely been key in the development of the rapid automatic analysis methods for recovering microvascular density and perfusion in SDF images described in the third chapter. Dirk, it is absolutely thanks to your great mathematical skills combined with your patience that we managed to bring the recovery of oxygen tension histograms from oxygen-quenched phosphorescent decay traces using multi-exponential curve fitting analysis to a successful end. Our paper served as both my Master thesis and as the seventh chapter of my PhD thesis.

I would also like to thank the guys from the Medical Technology Development department for the great support throughout my research. You are an amazing group of professionals, converting sometimes incoherent thoughts and ideas into practical solutions. The AMC should be more appreciative having you.

Moreover, I would like to thank the members of the promotion committee. It is a great honor having such an impressive mélange of experts assessing my thesis and being present during the PhD ceremony. Dear Prof. Spaan and Prof. Van Leeuwen, besides being part of the promotion committee, you have provided a continued support for me and our laboratory with your extensive knowledge and experience. For this I would like to express my sincere gratitude. Dear Prof. De Mol, Prof. Van Gulik, Dr. Boerma, and Dr. Van Bommel, I truly appreciate having specialists of such caliber, who have shown consistent interest in the physiology of the microcirculation during surgery and critical illness, as a part
of the committee. Prof. Payen, it is both an honor and a pleasure having you present at the PhD ceremony. The collaboration between our departments has led to great publications as well as to great friendships. I hope we can pursue this in the future.

Ten slotte, maar bovenal, wil ik graag mijn grootouders, ouders, broer en zus bedanken. Jullie liefde en trots zijn altijd mijn grootste drijfveren geweest, zowel voor als tijdens mijn promotietraject. Toen ik als stagiair in het AMC begon, maakten jullie je zorgen over mijn fanatieke arbeidsethos en de daardoor verminderde nachtrust en gezondheid. Toch zijn jullie me altijd blijven steunen, wat er toe heeft geleid dat ik nu de eindstreep heb gehaald. Promoveren doe ik dan ook niet alleen voor mezelf, maar ook voor jullie. Liefs, Rick
