The completion of this thesis marks the end of both my PhD project and a major period in my life. The years spend on this project have allowed me to develop professionally as well as personally. For this, I am grateful to a great number of people who have contributed directly or indirectly. Although I have attempted to thank as many people as possible below, the list is certainly far from complete. Rest assured that you are also appreciated if you are not specifically mentioned, if only for taking the time to read (part of) this thesis.

First, I would like to thank my promoter and supervisor, Prof. Dr. Klaas Hellingwerf, for giving me the chance to work on this project. Klaas, I would also like to thank you for your continuous support throughout my career, starting from a master thesis all the way up to my current job as a pre-doc (soon-to-be post-doc). I am glad that your door is always open (often literally), as I greatly value your opinion and input, and have always enjoyed our (scientific) discussions.

My thanks also go out to the members of my thesis committee, who have agreed to take the time to read my thesis on short notice.

I am also very grateful for the opportunities to look beyond the walls of the University of Amsterdam. Meeting other people and seeing how things are done in other labs has greatly broadened my horizon. Thanks to Prof. Dr. Peter Graumann for providing an internship position in Freiburg im Breisgau, and to Dr. Jon Marles-Wright and Prof. Dr. Rick Lewis for allowing me to work in Newcastle upon Tyne for a while. I also greatly enjoyed the many conferences I have been to, especially those outside of the Netherlands. Not that the conferences in the Netherlands have not been interesting and stimulating, but places like Veldhoven simply have a hard time competing with Austria, France, Germany and the United States... For this I also wish to thank the funding agencies that have helped to make this possible. This obviously includes the university, but also the BioCentrum Amsterdam, the Boehringer Ingelheim Fonds, the Federation of European Microbiological Societies (FEMS), and the Genootschap ter bevordering van Natuur-, Genees- en Heelkunde (twice). I am also grateful for the opportunity to look slightly further into our institute during my time as a member of the SILS PhD/PD Council.

I want to thank all members and students of the Molecular Microbial Physiology group for valuable comments during work discussions, and for providing an enjoyable work environment. Sadly, there have been way too many of you to mention. Similarly, my thanks go out to the members of the Molecular Biology and Microbial Food Safety and the Mass Spectrometry of Biomacromolecules groups. I enjoyed sharing information, lab space, and equipment with many of you over the years.

Some members of the aforementioned groups deserve a special mention for their contributions to the work described in this thesis. I would like to thank Marcela for giving me a basis on which to build my project. Johnny and Yusuke: thanks for your valuable input in the modeling study, and before that for your assistance in the lab.
Many thanks as well to Jos, for helping me with many experiments, and for making sure our lab runs smoothly. And thank you, Dennis, for solving “it doesn’t work”, “we’ve run out of …”, and many other things which generally start with “oh, no…” and end with “but I need it now”. I am absolutely convinced that without the two of you our lab would have been reduced to a smoldering pile of rubble a long time ago.

Special thanks also to the people that shared an office with me at Roeterseiland, with Jos, Marijke, and Mark in particular. Many thanks as well to the architects of the Science Park 904 building, for ensuring there are practically no members of the MMP and MBMFS groups I have not shared a hallway an office with.

I also have to thank the many students that have made contributions to my PhD project, even if this contribution was only to make me take a break from actual work to do some supervision. Thanks to Jorick, Vincenzo, Martin, Francis, Vita, Laura, and the many students that visited me for short projects and practical courses. And, of course, to Angie and Pascal—I am happy you both found a job in our group. It may not always have shown, and I may not always have had sufficient time, but I have always enjoyed (attempting to) teach students.

Of course I cannot forget the members of the ’12.30 lunch group’. The core members are (or have been) Aleksandra, Alice, Andreas, Clemens, Marijke, Nadine, Orawan, and Philipp, and more recently also Aniek, Pascal, Que, and Vinod. But of course anyone who has tagged along at one time or another is equally appreciated. Our discussions over lunch and coffee are usually the highlight of the day, especially on one of those days when everything else seems to go wrong. It will never cease to amaze me how easily we can switch from a deeply scientific discussion to complete and utter nonsense (or how vague the dividing line sometimes seems to be). Also thanks for the out-of-work activities, from drinks and movies to beach volleyball. Andreas and Philipp, I am also very happy you agreed to be my paronymphs.

A PhD project does not confine itself to the university. Therefore, I also have a few other people to thank. First, I would like to thank my friends for, well, being my friends. In particular, I would like to thank Danny, Jan Simon, Lars, Maarten, and Martine, for making me have a great time during my chemistry Bachelor at the ‘other’ university in town.

My family has, of course, been essential in shaping me into the person I am today, and thus in allowing me to complete this thesis. Sinny and Hans, mom and dad: thank you for allowing me to do whatever I wanted to do, and for supporting me every step along the way. I cannot stress enough how happy I am to have been taught from a young age to have an open and questioning mind. Thanks also to Annelies, for always being there, and to Stefan, for making my little sister happy.

I would also like to thank my family-in-law for welcoming me into my second family, and for accepting me for who I am. This, of course, mostly applies to my parents-in-law, Elzo and Rosita, and to my sister-in-law, Senta, but also to the rest of the extended family.
On the author list of a publication, the last place is often reserved for the person who organized and streamlined everything. Just so in this thesis. Chantall, I am incredibly lucky to have you as my wife. I have no idea how my life would look without you, although I am sure it would be more messy and filled with food that goes into a microwave. I cannot truly relax anywhere except with you. You always give me a reason to go home.

I realize I just wrote an entire book on how light causes stress, but I must be different than *Bacillus subtilis*, because you are the light of my life, and there is no place I would rather be than with you. Thank you for supporting me, putting up with me, and for making me happy.
