Supporting cells in neovascularization: study on candidates for cellular therapy
van Beem, R.T.

Citation for published version (APA):
Contents

Chapter 1. Introduction/Scope of the thesis 9

Chapter 2. The presence of activated CD4+ T-cells is essential 33 for the formation of colony forming-unit-endothelial cells (CFU-EC) by CD14+ cells

Chapter 3. Monocyte derived colony forming unit-endothelial cells- (CFU-EC) enhance neovascularization in a validated ischemic hind limb model 55

Chapter 4. In vitro characteristics of blood outgrowth endothelial cells 69 from cord blood and peripheral blood for future therapeutic use

Chapter 5. Elevated endothelial progenitor cells during 93 painful crisis in sickle cell disease

Chapter 6. Mesenchymal stem cells activate endothelial 103 cells towards a proangiogenic state

Chapter 7. Recovery and functional activity of mononuclear 121 bone marrow and peripheral blood cells after different cell isolation protocols used in clinical trials for cell therapy after acute myocardial infarction

Chapter 8. General discussion 137

Summary/Nederlandse samenvatting 151

Appendix 157
