ACKNOWLEDGEMENTS

Throughout my time in graduate school - at University of Amsterdam, at University of Chicago where I spent two summers attending the Institute for Computational Economics and at Cowles foundation where I stayed during my fifth year, many people contributed towards the successful completion of this thesis. While they all deserve thanks I single out a few for special mention.

I thank Peter Boswijk and Kees Jan van Garderen. They gave me numerous supports and encouragements. They supported me to successfully apply several scholarships for my research projects. With these supports, I have opportunities to open my eyes to the beauties of Empirical Likelihood and its computations. I owe them thanks for constantly challenging me to achieve a higher standard of this thesis. I thank Kees Jan. Without him, I would be not able to pursue this career. I thank Peter. He made a great effort to instruct me in learning asymptotic theory. Also it was Peter who guided me to polish the codes and the simulation results. Although some of these results are not suitable for being presented in the thesis, Peter's effort is significant. Both Kees Jan and Peter spent a lot of time on improving the language of this thesis. While I know that the current content must still contain ambiguity, they had done all they could do for me.

I also thank Yuichi Kitamura and Kenneth Judd for their intellectural hints and messages. Their words are so inspiring and meaningful that reflections of these words lead me to exploring a large virgin land. The area is so large that I can only present few rough findings in this thesis. I will continue on this exploration and I hope to hear more words from you!

I thank Nan Yang and Yang Zu, also their wives, for teaching me how to "enjoy" a Ph.D candidate life. Drinking Heineken or Bavaria, having Chinese type home parties and boardgame nights together with exchanging many research ideas that never work out are sparkling lights in my lonely research life.

I thank Xiaoyu Shen and Xiye Yang for helping me to maintain a self-torture life style.

I thank Peter, Yuichi, Ken, Paulo Parente, Le Wang and Junjian Yi who lent their hands to me when I was in my worst time.

Finally, I thank my parents, Gao Jiyou and Song Lihong, and my wife, Tan Min. My self-interest decision of pursuing a Ph.D gave them worries and pains. Their understandings and supports are the main resources that I can continue on this path. To them, the result of my Ph.D study is simply a sheet of paper, but this thesis is dedicated to them.
