Acknowledgements
Acknowledgments
The completion of this thesis would not have been possible without the support of many people. Foremost among those are my highly esteemed promotors, professor Peter Reiss and professor Frank de Wolf who granted me the opportunity to embark on this research project. I would like to thank them for putting invaluable knowledge and time in my endeavor and for their continuous support. I am grateful to my co-promotor Ferdinand Wit for his insight and guidance on a variety of topics and many hours spend discussing study results. Furthermore, I would like to thank the review committee for spending time evaluating this thesis.

I would like to thank professor Amanda Mocroft for giving me the opportunity to work with her, for sharing her expertise and for her great hospitality during my stay in London.

Many thanks to professor Albert Hofman for introducing me to Epidemiology and for giving me the opportunity to participate in the programme for Clinical Epidemiology as a medical student.

I would like to acknowledge my dear colleagues at SHM for all the good times, occasional brilliant humour, and for their time and efforts put in collecting, monitoring and managing the data used in the studies described in this thesis. My roommates from SHM, especially Luuk Gras and Colette Smit are gratefully acknowledged for sharing their statistical and epidemiological knowledge with me. Many thanks to Ard van Sighem for his scientific input, in general and on several of the papers described in this thesis. Many thanks to the datamonitors and Rosalind Beard for managing the database, and Sima Zaheri for managing the quality of data. Special thanks to Anna Jansen and all colleagues collecting data for their extra work put in the project on severe chronic liver disease. I am thankful to Mariska Hillebregt, Shula Grivell and Bianca Slieker for their practical advice over the years. Many thanks to Danielle de Boer, Louise Dolfing and SHM secretariat for their support over the years.

In addition, I would like to extend my appreciation to all individuals who provided their demographic and clinical data to the SHM database, without which none of the studies described in this thesis could have been completed. Furthermore, I am indebted to all professionals working in the HIV treatment centers for their ongoing contributions to this database. Many thanks to HIV treating physicians who have provided invaluable clinical input on articles described in this thesis.

I am thankful to my family (in law) and friends for sharing all the pleasures and sorrows beside work. I am especially grateful to my parents, and Stephanie, Alexandra and Justin for their interest and support. I am grateful to Dimitri for his many skills, practical and unconventional wisdom and for more than always being there for me.
The joint efforts of the above mentioned persons have resulted in this thesis, in which a series of studies on immune restoration and consequences of recovery of the immune system in HIV-1 infected patients is collected.

Anouk Kesselring

Amsterdam, September 2012.
