Acknowledgements
This thesis was made possible by the efforts and support of many people. It is impossible to name each and every one of them, but I want to express my gratitude to all of them.

However, I wish to single out a few people that have played a special role in the completion of this thesis.

First of all, I want to thank all the children and their parents or guardians that participated in both the Iron Study and the SevAna Study.

I am indebted to all who made the Iron Study possible: all the staff of the surgical wards of Cure Beit Hospital and Queen Elizabeth Hospital. Special thanks go out to Doctor John Cashman, Prof. Eric Borgstein, Prof. Geert Tom Heijkens and Prof. Elizabeth Molyneux who allowed me to conduct my research on their wards, to Mr Banda for teaching us how to perform a bone marrow aspiration, to everybody who prayed for the Iron Study, to Alice Bandawe Malili, Margreet Schilt and Tim Hall for their logistic support on the surgical ward, to Nelson Maseko, Montfort Bernard and Mercy Emana for recruiting study participants, to David Kachala for performing the laboratory tests and keeping me stocked with supplies, to Mike Moore, Bridget Denise, Danielle De Clercq, Wezi Gondwe and Mavis Menyere and the rest of the Welcome Trust Laboratory and to Beckman Coulter South Africa for enabling me to perform the reticulocyte measurements, to Kamija Phiri, Mary Makoti, Herbert Longwe for providing logistic support in the College of Medicine in Blantyre, to Harold Tjalsma, Erwin Wegerink, Siem Klaver and Anita van Schijndel from Hepecdinanalysis.com for performing the hepcidin measurements, to Rob Kraaijenhagen and Annet de Bats from the Clinical Laboratory of the Meander Medical Centre for assisting in the iron marker asessments. Furthermore, I wish to thank Job Calis and all the other staff of the SevAna study team for supplying the extensive and excellent data set, which among others was extended by the support and effort of the Parasitology Department of the LUMC.

I express my thanks to my supervisor Prof. dr. Bernard Brabin and to co-supervisors Dr. Job Calis and Dr. Michael Boele of Hensbroek.

Dear Bernard, you are the one who has passed the final judgment on my work. With your international experience in the field of science and health and your inexhaustible knowledge of the literature on tropical paediatrics you have steered our research group around the intricacies and pitfalls of scientific research. Also, being a native speaker of English, you have made sure that we did not all too blatantly abuse your mother tongue in the texts we produced.

Dear Michael, as my second co-supervisor you took more than a casual glance at the progression of my PhD. Over the years I have gotten to know you as an enthusiastic, highly creative, nicely chaotic though very disciplined researcher; you have made me feel at home in the Global Child Health Group. I hope to continue to work with you in future.

Dear Job, at a symposium on tropical paediatrics in 2007, you held a talk about your PhD project in Malawi. My enthusiasm for research in the tropics was ignited there and then and we kept in touch. Being colleagues in the St. Lucas Andreas Hospital, we wrote a grant proposal together. I was delighted to be able to start my research project in 2009. You boosted my confidence by trusting me to find my own way forward along the path of scientific research. You have been a great mentor. I have greatly benefited from your ability to provide clear answers to difficult questions, from your enthusiasm, your perceptive comments and, of course, your subtle humour. When we met to discuss the progress of my work you always encouraged me and you even had an open ear for any private concerns. These meetings allowed me to recharge my batteries and gave
me the energy to get on with the job.

Special thanks go out to Tjalling Leenstra for his crucial role in the prolonged but successful search for reliable statistics. I have appreciated his critical insight, his enthusiasm and his persistence during this process. I also want to thank Brian Faragher and Ronald Geskus for sharing with us the benefits of their innovative statistical approach.

I am grateful to Heleen Dyserinck for the great assistance with the literature searches for Chapter 2 and 5.

I want to thank all co-authors for their critical and useful comments on my work, especially Lisette van Lieshout, Imelda Bates and Dorine Swinkels.

I wish to express my gratitude to the members of the committee, Prof. dr. F.G.J. Cobelens, Prof. dr. H. S. A. Heymans and Prof. dr. V. Mwapasa, Dr. M. Peters and Prof. A. J.A.M. van der Ven, for reviewing this thesis and for agreeing to serve on the thesis committee. I am indebted to Prof. Heymans in particular for his moral support during the process of researching and writing my PhD.

I want to thank the Global Child Health Group for supporting my PhD project. Special thanks go out for Caroline Veraart for offering me a warm welcome at the start of my PhD, and for providing logistic support in the Netherlands as well as in Malawi; and, of course, for being such pleasant company over the past few years.

I am indebted to all the sponsors who made this thesis possible (see colophon), Numico, Janivo Foundation, Stichting Emma Steun and AIGHD, special thanks to Hans Sybrandy, Bert Veldhuizen Ella van den Brink, Esther Keijser, Wouter Keuning Wytske de Man Hanold van de Pol, Jan Bosch, Marco van der Spek, Peter Buitema and Ronald Kranendonk for cycling with the 250 kilometer to raise funding for my project.

I want to express my thanks to the Emma’s Children Hospital, to Diederik Bosman, to prof Heymans for supporting and believing in the projects of the GHCG. Thanks to the St Lucas Andreas Hospital for the experience as clinical doctor which were useful during my research. I also want to thank the Liverpool School of Tropical Medicine for their statistic support.

Fellow researchers Amber, Machtelt, Marlies and Quirine, thank you for welcoming me into your metabolic group despite my hematologic background. Dear Quirine, how we would have wished that you had been able to defend your thesis! Unfortunately, fate had other plans. You continued to support us till the end. I am indebted to Michael Esan for asking me to be his co-author and for being such agreeable company in Malawi as well in Amsterdam. I also thank Jessica, Veronica, Imke, Evelien, Servet and all the other colleagues in the Rode Luifel for their moral support. Thanks to Carline Tacke for providing diversity during my PhD.

I am grateful to Annemieke Tuinhofdemoed for her excellent work on the lay-out of this thesis and to Karst Janneke Rogaar, for her artistic embellishments of my work.

I am indebted to all my friends in Malawi for giving me the experience of living and working in Malawi and enjoying Malawian life. Special thanks go out for Lucia, Clementine and Karen for the warm home from first till the last day.
I thank all my friends in the Netherlands for their patience, their understanding and their invaluable support. Esther, Welmoed en Wytske also thanks for the distant support while I was abroad. Esther and Rianne, thank you for co-reading. Gwen van Lammeren, my saving neighbour, thanks for helping me out when needed.

I am grateful to my parents Leendert en Maaike, for believing in me and supporting me throughout my project, for listening to me in good times and in bad times, for reading my work, for their unconditional love and care. I thank my sisters Roos and Noor for their patience and their encouragement and for keeping me grounded during the whole process of preparing my thesis.

I gratefully remember and thank my beloved grandfather Prof. dr. Lambertus de Rijk. His passion for knowledge has motivated and inspired me and will continue to do so.

Finally, I would like to thank Manook, for being the special person that he is.
