THE ROLE OF THE PROTEASOME IN HUNTINGTON’S DISEASE

Sabine Schipper-Krom

“A man who dares to waste one hour of time has not discovered the value of life”

Charles R. Darwin (1809-1882)
The studies described in this thesis were performed at the Department of Cell Biology and Histology of the Academic Medical Center, University of Amsterdam, The Netherlands.

The production of this thesis was financially supported by the University of Amsterdam.

Design and lay-out: Sixtyseven Communicatie BV - www.sixtyseven.com
Production: Gildeprint Drukkerijen - www.gildeprint.nl
Publisher: S. Schipper-Krom
Cover picture: Living cells expressing mHtt(Q103)-GFP in blue and in white labeling with activity based probe for active proteasome visualization

# Table of Contents

1. Short introduction and outline of the thesis
2. The ubiquitin-proteasome system in Huntington's disease
3. Mimicking proteasomal release of polyglutamine peptides initiates aggregation and toxicity
4. The DNAJB6 and DNAJB8 chaperones prevent intracellular aggregation of polyglutamine peptides
5. Expanded polyglutamine-containing N-terminal huntingtin fragments are entirely degraded by mammalian proteasomes
6. Enlightening proteasomes: methods to visualize their intracellular distribution, activity and interactions
7. Dynamic recruitment of active proteasomes into polyglutamine initiated inclusion bodies
8. Modulating proteasome activity in Huntington's disease
9. Summary and conclusion

& Addendum
