Does a donation induce stress in blood donors, and does this affect the donor’s hemostasis? Indeed, the results presented in this thesis show the presence of a donation-induced psychological, hormonal and physiological stress response. Thereby, psychological and physiological stress responses indicate a decrease in stress from pre- to post-donation, while peaking during needle insertion and uncoupling. The donation-induced stress responses are associated with small but clear pro-hemostatic effects. In conclusion, a whole-blood donation induces stress in blood donors, thereby affecting the donor’s hemostasis.
GIVING BLOOD: DONOR STRESS AND HEMOSTASIS

Don’t let your blood run cold

Maurits D. Hoogerwerf
The studies described in this thesis were carried out at the Academic Medical Center/University of Amsterdam, Department Coronel Institute of Occupational Health; Amsterdam Public Health research institute, Amsterdam, The Netherlands. Research in this thesis was financially supported by the department of Donor studies, Sanquin Research, Amsterdam, the Netherlands.

Cover design Lisa Klinkenberg, Hoorn, the Netherlands.

# Contents

**Part I Introduction**  
1 General introduction  
2 Factors associated with psychological and physiological stress reactions to blood donation: a systematic review of the literature

**Part II Anticipatory stress and negative experiences**  
3 Negative experiences and pre-donation blood pressure at the subsequent donation in blood donors  
4 Negative experiences and pre-donation blood pressure at the subsequent donation: the role of attitude and anxiety in blood donors

**Part III Stress during a donation**  
5 Psychological and hormonal stress reactions during a blood donation  
6 Physiological stress reactions during a blood donation

**Part IV Hemostasis**  
7 Small but clear pro-hemostatic effects of blood donation-induced stress on donor’s hemostasis

**Part V General discussion**  
8 General discussion
