Understanding gene expression variability in its biological context using theoretical and experimental analyses of single cells

Hermannus Kempe

Understanding gene expression variability in its biological context using theoretical and experimental analyses of single cells

Hermannus Kempe

Understanding gene expression variability in its biological context using theoretical and experimental analyses of single cells

Hermannus Kempe

The research described in this thesis was funded by the Research Priority Area Systems Biology of the University of Amsterdam.

The research was carried out at the laboratory of Sythetic Systems Biology and Nuclear Organization, Swammerdam Institute for Life Sciences, University of Amsterdam, The Netherlands.

Understanding gene expression variability in its biological context using theoretical and experimental analyses of single cells

ACADEMISCH PROEFSCHRIFT

ter verkrijging van de graad van doctor
aan de Universiteit van Amsterdam
op gezag van de Rector Magnificus
prof. dr. ir. K.I.J. Maex
ten overstaan van een door het College voor Promoties ingestelde commissie,
in het openbaar te verdedigen in de Agnietenkapel
op woensdag 15 november 2017, te 10.00 uur
door Hermannus Kempe
geboren te Montfoort

Promotiecommissie:

Promotor:	dhr. prof. dr. H.V. Westerhoff	Universiteit van Amsterdam
Co-promotores:	mw. dr. P.J. Verschure	Universiteit van Amsterdam
	dhr. prof. dr. F.J. Bruggeman	Vrije Universiteit Amsterdam
Overige Leden:	dhr. prof. dr. A.B. Houtsmuller	Erasmus Medisch Centrum
	dhr. prof. dr. A.H.C. van Kampen	Academisch Medisch Centrum
	dhr. prof. dr. P.J. Lucassen	Universiteit van Amsterdam
	dhr. dr. L. Magnani	Imperial College London
	dhr. dr. E.M.M. Manders	Universiteit van Amsterdam
	dhr. prof. dr. S.J. Tans	AMOLF
	dhr. prof. dr. R. Versteeg	Academisch Medisch Centrum
Faculteit:	Faculteit der Natuurwetenschappen, Wiskunde en Informatica	

Contents

Contents iii

1 Introduction 1
- 1.1 Gene expression regulation . . . 2
- 1.2 Phenotypic plasticity . . . 3
- 1.3 The epigenetic chromatin state . . . 3
- 1.4 Network motifs providing phenotypic plasticity . . . 4
- 1.5 Variability in isogenic populations . . . 5
- 1.6 Constitutive and bursting transcription models . . . 7
- 1.7 Measuring expression variability . . . 8
- 1.8 Thesis outline . . . 9

2 The volumes and transcript counts of single cells reveal concentration homeostasis and capture biological noise 13
- 2.1 Abstract . . . 14
- 2.2 Introduction . . . 14
- 2.3 Results . . . 15
  - 2.3.1 Volume statistics of single cells . . . 17
  - 2.3.2 mRNA concentration statistics of single cells indicate mRNA concentration homeostasis . . . 18
  - 2.3.3 The volume scaling of the mRNA concentration statistics explains the concentration variability . . . 19
- 2.4 Discussion . . . 22
- 2.5 Materials and Methods . . . 24
  - 2.5.1 Single Molecule RNA FISH . . . 25
  - 2.5.2 Image acquisition . . . 25
  - 2.5.3 Image analysis . . . 25
- 2.6 Supplemental Information . . . 26
  - 2.6.1 Identifying the nucleus with DAPI . . . 26
  - 2.6.2 Experimental variation and statistics . . . 26
  - 2.6.3 The law of total variance for mRNA numbers and concentrations of mRNA 28
  - 2.6.4 Average mRNA numbers correlate with protein expression . . . 34
  - 2.6.5 Volume dependencies within the data . . . 34
  - 2.6.6 Probe sequence . . . 39

3 Statistics and simulation of growth of single bacterial cells: illustrations with *B. subtilis* and *E. coli* 41
- 3.1 Abstract . . . 42
- 3.2 Confirmation of balanced growth during the microscopy experiment . . . 58

3.3 Cell length and fluorescence data of a balanced growing *E. coli* population 60
3.4 The cell-size homeostasis mechanism as evident from our data 61
3.5 Cell length as an approximation for cell volume 62
3.6 Growth rate of *B. subtilis* and *E. coli* along the cell cycle, in terms of cell length and cell age 65
3.7 Fluorescence concentration and fluorescence noise for *B. subtilis* and *E. coli* along the cell cycle, in terms of cell age 66
3.8 StochPY extended with cell growth and division 68
3.8.1 Stochastic simulation of single-cell growth and gene expression matches theory 69
3.8.2 Conditions to interrelate a lineage and full tree simulation 70
3.8.3 The joint distribution of cell age and generation time 72
3.8.4 Illustrations of StochPy simulations with cell growth and division 73
3.8.5 Comparing StochPy simulations with cell growth and division to analytical solutions 74

4 MeCP2 accelerates the transition rate of transcription repression dynamics measured at a defined chromatin locus in single cells 83
4.1 abstract 84
4.2 Introduction 84
4.3 Results 85
4.3.1 Experimental approach 85
4.3.2 Biphasic transcription repression 87
4.3.3 MeCP2 facilitates increased transcription repression responsiveness . . . 88
4.4 Discussion 90
4.5 Materials and Methods 92
4.5.1 Plasmids 92
4.5.2 Time-lapse microscopy measurements 93
4.5.3 Image analysis 93
4.5.4 Fluorescence Recovery After Photobleaching (FRAP) 94
4.5.5 MS2 diffusion model 94

5 Transcription recovery after UV-C-induced DNA damage: the relationship between UV-C dose, gene size and DNA repair at the single gene level 101
5.1 Results and discussion 103
5.1.1 Measurement of transcription inhibition with smRNA-FISH 103
5.1.2 UV-C-induced transcription inhibition is dependent on gene size and UV dose 104
5.1.3 mRNA export kinetics of *PLOD2* and *GAPDH* 105
5.1.4 Transcription recovery within six hours 106
5.1.5 Modeling of DNA damage repair 106
5.1.6 Estimation of the DNA damage repair rate 107
5.2 Conclusion 108
5.3 Materials and Methods 109
5.3.1 Cells and cell culture 109
5.3.2 DNA Damage and transcription inhibition 109
5.3.3 Single Molecule RNA FISH 109
5.3.4 Image acquisition 109
5.3.5 Image analysis 109

5.3.6 DNA damage and repair model 110
5.3.7 Combining DNA damage and gene transcription 110

6 Identification of cells with an irregular expression status in ERα breast cancer by single molecule RNA FISH 115
6.1 Abstract 116
6.2 Introduction 116
6.3 Results and discussion 118
6.4 Materials and methods 119
6.4.1 Cell cultures 119
6.4.2 smRNA FISH 120

7 General Discussion 121
7.1 Biologically relevant variation in gene expression is best captured by concentration variability 122
7.2 A theoretical framework of cell growth allows the simulation of gene expression in growing cell populations 123
7.3 A chromatin-dependent delayed response of gene deactivation 123
7.4 The half-life of DNA damage, which determines the transcription recovery rate, varies depending on UV-dosage 124
7.5 Single cell analysis reveals that subpopulations of breast cancer cells may cause treatment resistance 125
