# TABLE OF CONTENTS

1  General introduction  

Part I: Coagulation and fibrinolysis in tuberculosis  

2  Pulmonary tuberculosis induces a systemic hypercoagulable state.  
   *Submitted*  

3  The endothelial protein C receptor and activated protein C play a limited role in host defense during experimental tuberculosis.  
   *Thrombosis and Haemostasis, 2013*  

4  The thrombomodulin lectin-like domain does not change host responses to tuberculosis.  
   *Thrombosis and Haemostasis, 2013*  

5  Plasminogen activator inhibitor type I may contribute to transient, non-specific changes in immunity in the subacute phase of murine tuberculosis.  
   *Microbes and Infection, 2012*  

Part II: Coagulation and fibrinolysis in melioidosis  

6  Endogenous protein C has a protective role during Gram-negative pneumosepsis (melioidosis).  
   *Journal of Thrombosis and Haemostasis, 2013*  

7  A thrombomodulin mutation that impairs active protein C generation is detrimental in severe pneumonia-derived Gram-negative sepsis (melioidosis).  
   *Submitted*  

8  Overexpression of activated protein C is detrimental during severe experimental Gram-negative sepsis (melioidosis).  
   *Critical Care Medicine, 2013*  

9  Overexpression of the endothelial protein C receptor is detrimental during pneumonia-derived Gram-negative sepsis (melioidosis).  
   *PLoS Neglected Tropical Diseases, 2013*
10 Deficiency of protease-activated receptor 1 limits bacterial dissemination during severe Gram-negative sepsis (melioidosis).
*Microbes and Infection, in press*

11 Mice lacking the lectin-like domain of thrombomodulin are protected against melioidosis.
*Critical Care Medicine, in press*

12 Endogenous tissue-type plasminogen activator impairs host defense during severe experimental Gram-negative sepsis (melioidosis).
*Critical Care Medicine, 2012*

13 Plasminogen activator inhibitor type I contributes to protective immunity during experimental Gram-negative sepsis (melioidosis).
*Journal of Thrombosis and Haemostasis, 2011*

14 Endogenous alpha-2-antiplasmin is protective during severe Gram-negative sepsis (melioidosis).
*American Journal of Respiratory and Critical Care Medicine, 2013*

**Part III: ...and beyond**

15 Intrabronchial activated protein C enhances lipopolysaccharide-induced pulmonary responses.
*European Respiratory Journal, 2012*

16 A new murine model to study musculoskeletal tuberculosis.
*Submitted*

17 Summary, general discussion and conclusion
