Acknowledgements

The present study was funded by European Commission under the FP7-Research Infrastructures programme (Grant Agreement no. 227628) as a part of the Integrated Network on Climate Research Activities on Shrubland Ecosystems (INCREASE) project. I would like to thank the Royal Netherlands Army (Koninklijke Landmacht) for access to the Oldebroek field site.

I am deeply appreciative of the support and contributions of my promoter, Karsten Kalbitz, and co-promoters, Albert Tietema and Emiel van Loon. I would like to thank them and the University of Amsterdam (Universiteit van Amsterdam) for making this research possible.

I would also like to thank my colleagues who contributed in many different ways to my research. My trenching trial could not have been established without the field assistance of Albert Tietema, Daan Asscheman, Karsten Kalbitz, Joke Westerveld, Andrea Carboni, Richard van Heck, Jennifer Schollee, Ferenc Vilisics and Niina Ala-Fossi. Other field assistance was gratefully received from Sharon Mason, Louise Andresen, Elsa Sorgedrager, Jessica Noun, Laura Fernández Fraile, Rutger van Hall and Casper Cusell. I also recognize the hard work of the department technicians who made research on the long-term climate manipulation trial possible and sincere thanks are given to Bert de Leeuw, Leen de Lange, Joke Westerveld, Leo Hoitinga and Piet Wartenbergh. I appreciated the many interesting and stimulating discussions with colleagues during my studies. These developed my ideas and also provided many laughs, including the carbon stock discussions with Chiara Cerli, statistical dilemmas with Emiel van Loon, the old science of soil acidification with Koos Verstraten, the technical discussions and golden egg stories with Albert Tietema and the coffee crew of Jens Altmann, Alex Hanke and Susanne Waaijers.

The beautiful photos used on the thesis cover and for the facing pages of Chapter 3 and the Summary were provided by Niina Ala-Fossi. The thesis document was typeset, edited and proof read by Rosemary Kopittke and this help is gratefully acknowledged.

And finally, but by no means least, I could not have completed this study without the help, support and understanding of Ben James. It is his cover design that wraps around my work and it is to him that this thesis is dedicated.
