Having conducted public health research for 10 years and wondering whether I will ever muster the necessary energy towards a PhD degree, it took just one evening in Amsterdam with my colleague and friend Rob van Hest to convince me of its feasibility.

I sincerely thank my promotor Professor Martien Borgdorff in accepting me as a PhD student, and guiding me through the process of bringing it all together. To this day I wonder where my copromotor Dr Rob van Hest summoned all his time, energy, effort, patience and mentorship that proved necessary to get me through this thesis. Working hard and partying hard is another lesson best learned from him. My thanks also to professors Boele van Hensbroek, Coutinho, Lange, van Roosmalen, Sanders and Zaaijer, for their willingness to become members of the doctoral degree committee and their review of my work.

Today’s public health research usually is collaborative, involving multiple institutions and investigators, across borders and oceans. To these, my co-investigators, reviewers, survey and research staff, I owe a depth of gratitude. Survey respondents’ and research participants’ interview data and biological specimens made the research presented here possible, therefore, and unbeknownst to most of them, expanding science’s body of knowledge ever so slightly.

Throughout much of my professional career, I learned from my tutors, supervisors, mentors, and colleagues. Kevin DeCock (then at the London School of Hygiene and Tropical Medicine) made me realize how important it is to read and stay abreast of the relevant literature. Eve Lackritz provided me with one of my best training experiences, as an Epidemic Intelligence (EIS) officer at the CDC. Always making time for me, she taught me a great deal in field epidemiology and presenting data. Eve arranged for much of the research in my early years at the CDC, even already before I arrived in Atlanta. I had never heard about human herpesvirus 8
before and yet she sent me straight to Uganda and made possible for me some of the most exciting research an EIS officer can wish for. Phil Pellett took time to teach me scientific writing, reviewing data critically, and showed me the importance of integrity and rigor in science. Theresa Diaz was a great mentor and excellent manager, demonstrating that science and routine program work do not need to exclude each other in our daily work providing technical assistance to countries far and wide. Jonathan Mermin showcased me how brilliance, passion, and vision can make amazing things possible. John Hancock was a good example of humbleness and self-mockery covering up brilliant statistical skills.

Thanks to Peter Kaiser who in our early days of studying tropical medicine stimulated me to peek through the window of science, then in the shape of CD-ROMs and hard copy indexes in Bangkok. Peter Kreidl gave me yet another push, housing me during my MSc thesis in Tyrol and helping with data collection.

My sister Carmen Petrosian-Husa I thank for her help both in the beginning, entering data with me for my MSc thesis work, and at the very end, working on the layout of this thesis and creating the cover of this thesis booklet.

My mother made it possible for me to be where I am today. Never ceasing to believe in me, she arranged for special tutors during childhood when I seemingly wasn’t quite up for my school’s curriculum. She supported me all the way through school and university and continues to be a mother as proud for her son as any child can wish for. If not for myself, I would have pursued this PhD to make her happy. Franz, my father, was ever so patient when my mother again and again prioritized my needs over his.

Raine, my wife, never made me feel guilty when I spent my time on my laptop instead with her. Entire gardens in Kampala and Atlanta were beautified by her while I hid indoors with my computer and papers.
