Introduction

Despite the foreseeable strain that ageing populations and increased cancer deaths will place on our health systems, European citizens' access to end-of-life services varies. There are a number of good examples of national end-of-life care policies within Europe, such as in the UK, but most European countries lack national policies regarding palliative and end-of-life care. The aim of our research was to determine public views regarding end-of-life care in the face of serious illness. Methods: Implementation of a pan-European population-based survey with adults in England, Belgium (Flanders), Germany, Italy, the Netherlands, Portugal and Spain. Three stages of analysis were completed on open-ended question data: (i) inductive analysis to determine a category-code framework; (ii) country-level manifest deductive content analysis; and (iii) thematic analysis to identify cross-country prominent themes. Results: Of the 9344 respondents, 1543 (17%) answered the open-ended question. Two prominent themes were revealed: (i) a need for improved quality of end-of-life and palliative care, and access to this care for patients and families and (ii) the recognition of the importance of death and dying, the cessation of treatments to extend life unnecessarily and the need for holistic care to include comfort and support. Conclusions: Within Europe, the public recognizes the importance of death and dying; they are concerned about the prioritization of quantity of life over quality of life; and they call for improved quality of end-of-life and palliative care for patients, especially for elderly patients, and families. To fulfill the urgent need for a policy response and to advance research and care, we suggest four solutions for European palliative and end-of-life care: institute government-led national strategies; protect regional research funding; improve end-of-life care access, provision and recognition across Europe; and dying, the cessation of treatments to extend life unnecessarily and the need for holistic care to include comfort and support.
our research was to determine public views regarding end-of-life care in the face of serious illness. To ensure that the urgent need for an European policy response is informed by contemporaneous views, we analysed data from an open-ended survey question to answer the research question ‘What do the public want to say about care in the context of serious illness at the end of life?’

Methods

We conducted a population-based telephone survey (May–December 2010) using random-digit dialling in England, Germany, Italy, the Netherlands, Spain, Portugal and Belgium (Flanders). Further details about our linguistic validation procedures, data and methodology are available. Our 28-item survey, that was conducted in a uniform manner in all countries, comprised six sections: (i) socio-demographics; end-of-life care preferences and priorities regarding (ii) information; (iii) care options; (iv) symptoms and problems; (v) decision-making; and (vi) preferred place of death. A hypothetical scenario formed the basis of the survey: ‘imagine a situation of serious illness, for example cancer, with less than one year to live’. The open-ended question we analysed was positioned at the end of the survey; ‘Is there anything else you would like to say? Interviewers were instructed to type verbatim the participant’s comments. Eligibility criteria were as follows: ≥ 16 years, able to provide informed consent and no hearing or language barrier that precluded participation.

A post-positivist paradigm informed analysis, meaning we aimed to produce verifiable, accurate and consistent findings through the use of a selection of systematically applied research methods, including low-level statistics: we sought to establish findings through attending to recurring patterns within the data. Data quality was checked (for clarity, completeness and accuracy); and data of insufficient quality were not analysed. Qualitative analysis involved three stages. First, open coding to generate an inductively derived category-code framework was completed. Informed by maximum variation principles, we analysed a subset of countries (England, Portugal and Spain) with contrasting health care systems, income per capita and palliative care provision to build a comprehensive framework. The framework was structured around categories that had been successfully used previously in palliative care research and tested with all countries for outliers. Second, country-level manifest deductive content analysis was conducted by a multi-lingual research team to identify the top country message and to construct a textual-representation of this top country message. The top message was the most frequently shared message relevant to policy and commissioning excluding, for example, personal stories and suggestions on how to improve our survey. Third, thematic analysis of country-level findings to identify prominent themes was completed. A prominent theme was a message shared across five or more countries.

Standard coding templates were used, analysis was conducted by one or more native speaker per country, and analysis was checked by a second researcher. Findings were translated into English after the top message was identified. To determine the transferability of beliefs and experiences within the data, we compared socio-demographic characteristics of those that did and did not provide comments to identify significant differences (P < 0.05). Chi-square tests were used for gender; living arrangements; marital status; religion/denomination; experiences of illness, death, and dying. Mann–Whitney tests were used for urbanization level, educational attainment, financial hardship and health. A t-test was conducted for age (mean age). Ethics approval was secured from the lead academic centre (ref: BDM/08/09–48). Local ethics approvals and/or data protection agency notifications were also secured where necessary.

Results

Respondents

Of 45242 approached, 9344 (21%) participated. Refusal reasons included the following: disinterest (59%), time (17%), reluctance to complete a telephone survey (3%), the topic (3%). Across countries, the mean age was 51 years. Respondents were mostly female (66%); married/partnered (65%); primary-secondary school level educated (61%); religious (64%); born in the country that the survey was conducted in (93%). In the past 5 years, 10% had been seriously ill, 53% had cared for someone in their last months of life, 65% had a close relative or friend who had either been seriously ill or had died (70%) (Supplementary table S1).

Of the 9344 respondents that completed the survey, 1543 (17%) provided an answer to the open-ended question. For those who commented, we had an over-representation of older individuals (P < 0.001), females (P < 0.001), the religious (P < 0.001), those who lived in big/small town/city (P < 0.001), those who had experiences of serious illness (P < 0.001), experiences of death (P = 0.009) and of providing care during the end-of-life (P < 0.001). Fewer divorced and single people made comments; yet, more widowed individuals commented (P = 0.003). There was an under-representation of those who were living comfortably on their income (P < 0.001) (table 1).

Interviews and quality

On average, all interviews took 15.5 min (standard deviation 5.8) to complete. Results from quality checks meant that data from 1452 respondents was analysed. Responses to open-ended questions averaged 23 words (table 2).

Category-code framework and top country-level messages

The final framework consisted of three categories and 45 codes: (i) content; (ii) agent; and (iii) message (five sub-categories) (Supplementary tables S2 and S3). During deductive analysis, the 31 codes for the message category were assigned 2298 times (table 3). After removing categories that were not related to policy recommendations, e.g. personal stories and suggestions on how to improve our survey, the top message for each country and across all countries was a call for better quality care, information and access for patients and carers (815 codes) (table 3).

England

Respondents were grateful for the mostly good care they received ‘...care was excellent’ (ID800403563), but they also wanted improved support for carers ‘There is not enough support for carers’ (ID800403553) and better access for all, including in people’s homes ‘...put palliative care into people’s homes’ (ID800426795). Many emphasized the importance of dying and not extending life unnecessarily ‘I really don’t think the medical institutions should try to extend life. They should let people go when they need to go, if there is no future for them’ (ID800423605). Respondents were divided about their support or lack of support for euthanasia, but most said that choice about this was important.

Belgium (Flanders)

Respondents called for improved quality of care ‘The present way of care-giving can be improved’ (ID800506056) especially for the elderly ‘They should improve the care and the accompaniment of the elderly’ (ID8004898500).

SD, standard deviation; NS, not significant.

a: Sums may not always amount to the total sample number because of missing values on variables. Percentages may not always add up to 100 because of rounding.

b: Missing data: 8.8% for age, 0.2% for urbanisation level, 0.7% for marital status, 0.8% for religion/denomination, 2.2% for education, 1.1% for financial hardship, 0.6% for health; 0.4% for being personally diagnosed with a serious illness; 0.4% for having a close friend diagnosed with a serious illness, 0.3% for experiencing the death of a relative or friend and 0.3% for caring for someone ill. There was no missing data for gender. *P<0.001, **P=0.003, ***P=0.009.

Germany
Better quality care and access was required for patients, especially the elderly, and families. Plus, the need for free and affordable health care, increased numbers of hospices and palliative care institutions, better rural health care and more information on death, dying and palliative care was identified. Most with illness experiences (past or present) were grateful for the good care they received, but respondents worried about the affordability of health care in the face of public and private health insurance, which was perceived to create huge social difference and inequalities, especially among those with little money and the elderly. Respondents called for re-introducing the human element into health care ‘Hospitals need to care better for patients and their relatives – not treat them like a number’ (ID 10644708), including an emphasis on psychological care and quality of life ‘...clinicians don’t do enough to improve the quality of life of patients’ (ID10644877). Achieving individual preferences, respecting wishes at the end of life and not being kept alive when there was no hope was important ‘To keep people alive artificially is against people’s dignity because it does not consider the needs of that person’ (ID10644463).

Italy
One-third of Italian respondents were dissatisfied with the care they had received, and they complained about the Public Health Service ‘The Public Health Service must... change. The waiting time is too... long’ (ID800498420). Respondents commented on the inefficiency of some hospitals, especially in the south ‘The bad practice in the south (of Italy) is incredible’ (ID800433745) and particularly regarding home care ‘In Italy home care is lacking, especially in the south’ (ID800476711). Respondents wanted palliative care in the home ‘Home care assistance should be available everywhere’ (ID800436444). Not extending life unnecessarily and the need to
be able to refuse unnecessary treatments were important. ‘We have to do something against the practice of the aggressive treatments. It’s wrong to extend life when it is unnecessary’ (ID800431819).

The Netherlands
Personal accounts stressed the need for improved quality of end-of-life and bereavement care for families ‘…there is much room to improve care for people who are bereaved. The “buddy system” (a volunteer who makes regular visits) works well’ (ID800490615). The importance of more information and openness of medical staff was highlighted ‘More openness from medical doctors would be appreciated’ (ID800482446). A small number of people described illness experiences (past or present), which were sometimes combined with a preferred place of care and a wish to be in control.

Portugal
Respondents called for more hospital palliative care units ‘I wish more hospitals had more palliative care units…which should have good conditions as well as enough doctors and nurses. Many times patients are placed in care homes where they do not have access to proper care and treatment which would help them in their last months of life…’ (ID800473749) and increased palliative care access ‘I wish palliative care would broaden and reach as many people who need it…’ (ID800496130). A call for better quality care that included a human touch and adequate symptom control was evident ‘At the end of their lives, they should get all the comfort and affection from their families and from palliative care so that the person is not abandoned’ (ID80047189). Respondents wanted the right to die with dignity. Dying with dignity meant to die with autonomy and adequate pain control ‘People should die with some dignity, especially when facing a disease like cancer, they should die free of pain’ (ID800488331), recognized personal preferences and the choice of having loved ones close at all times. Some reported that family had to quit their jobs to be the main carer. The need for improved family support was evident ‘More help for people who are looking after relatives, someone who can go from time to time to help with logistics, allowing families to breathe and leave that context a bit, which is extremely heavy, physically and psychologically’ (ID800473015).

Spain
Calls for better quality care and access mainly focused on the human element within health care, access and better choice, information and quality ‘Sick people should be supported and have a better quality of life. Palliative care should be improved’ (ID800501476). Calls for person-centred care and the recognition of families’ needs were evident. Requests for better access and health care for specific conditions were found ‘There is a lack of help for people with Alzheimer’s disease from public institutions’ (ID800502331). Respondents said they worried about burdening others ‘If I had a serious condition I’d prefer to die rather than suffer. For me, it’s more important the quality of life. I wouldn’t like to be a burden to others’ (ID800499078).

Prominent message
Thematic analysis revealed six themes; two were evident in most countries: (i) an overall need for improved quality of end-of-life and palliative care, and access to this care for patients and families and (ii) the recognition of the importance of death and dying, the cessation of treatments to extend life unnecessarily and the need for holistic care to include comfort and support (table 4).
A call for improved quality and access

Our study showed that European citizens want improved access and quality palliative and end-of-life care for patients and families. Our finding is supported by the current situation within Europe where palliative care services have developed locally in culturally responsive ways in relation to local needs and populations. However, coverage remains patchy, with the number of services per million ranging from 0 to >20.25 Disparities between the quality of death and end-of-life care exist within Europe.2 Only a small number of national government-led palliative care strategies are available in Europe (including the UK, Poland, Switzerland, Turkey and Portugal). Existing strategies focus primarily on process measures, although a recent emphasis on outcome measures is evident, e.g. in Portugal).26–28 Second, protected research funding for palliative and end-of-life care designed to advance regional developments is needed. Our data suggest that regional research frameworks, such as the European Commission frameworks, need to allocate funds for palliative and end-of-life research for non-malignant groups and the elderly. Three, recognizing within and between country-level variations will aid regional development. Our data revealed perceptions of inequity between southern and northern Italy and fears about growing gaps between rich and poor citizens in relation to health care in Germany. Research has shown that regional differences matter, and internal regional policies are important in Italy.29 Additional national Italian palliative care issues, such as the general reluctance of physicians to prescribe opioid medications,30 need attention. In Germany, despite recent legislation to help ensure health care for all (the Statutory Health Insurance Competition Act),31 the number of uninsured individuals has been increasing,32 and palliative services remain patchy. Concern regarding this was evident in the data, especially for the elderly and poor. The public concerns identified in our study present a challenge for commissioners and policy makers. They also provide good examples of why it is important to consider intra- and inter-country variation when developing regional policies within Europe.

Recognition of the importance of death and dying, unnecessary treatments and holistic care

Our data show that the public wants death and dying to remain important, care to involve a human touch and unnecessary aggressive treatments that prolong life unnecessarily to stop. For the English respondents, this meant recognizing the importance of not extending life unnecessarily and having the right to refuse treatments. For the Italians, it meant taking action to stop unnecessary treatments. Concerns regarding the use of artificial devices to prolong life were apparent in Germany. The importance of a dignified death and being able to have family and friends nearby surfaced in Portugal. A growing body of evidence is mounting with regards to the increasing aggressiveness of cancer care towards the end of life33 and the implications of this, including (i) financial consequences; (ii) compromised quality of life; and (iii) lost opportunities for the introduction of non-invasive, life-prolonging interventions, such as palliative care.34 Research shows that physician–patient discussions about preferences are associated with lower rates of intensive interventions35 and care better aligned with preferences.36 We suggest a cohesive pan-European approach to training and education regarding preferences at the end-of-life, as this may help address the perceived imbalance between quantity and quality of life. Establishing European standards of training, education and service delivery may also be useful.

Study strengths and limitations

The limitations of our study should be considered including the following: (i) the overall low survey response rate and the possibility of systematic bias in our respondent group; (ii) the smaller group of respondents that supplied an answer to the open-ended question and the over- and under-representation of characteristics of those that commented; (iii) the variable data quality between countries; (iv) the absence of data from central and eastern Europe; and (v) the position of the open-ended question in the survey. To help overcome these limitations, we took steps to reduce selection bias, and we clearly reported the characteristics of those that did and did not make comments to allow for comparisons. We also discarded poor quality data and took steps to achieve theoretical and procedural rigor.

Our study shows that the European public recognize the importance of death and dying, and there is concern regarding the prioritization of quantity over quality of life, patient autonomy, comfort, support and dignity. Also, in the eyes of the public, poor palliative and end-of-life care quality and access persists. Our study provides a platform from which to integrate European citizens’ views into policy arenas. Achieving this integration is important, as it is central to democratic theory, and health care systems should aim to deliver care responsive to legitimate expectations of their citizens. We have provided four solutions to the European palliative and end-of-life care policy imperative. However, as some of our solutions are not new, it is necessary to ask a fundamental question on behalf of patients and families, a question that was evident in our data: is anybody really listening? ‘I wonder how much of what the public want will be acted on, there are all sorts of various funds and politics. I don’t mind giving my views I just, just hope that they’re recognised’ (ID800403265).

Supplementary Data

Supplementary data are available at EURPUB online.
Acknowledgements

The authors are most grateful to all the survey participants. They thank the European Commission for the financial support needed to undertake this study; BMG Research and ZEM University of Bonn for assistance in survey administration and data collection. They also thank our colleagues from PRISMA including the scientific committee who contributed to discussions and scientific review of the survey, including Stein Kaasa, Natalie Evans, Hamid Beniala, Ana Barros Pinto, Noël Derycke, Martine de Vlieger, Let Dilien, Michael Echteld, Nancy Gikaara, Johan Menten, Bregje Ouwuteaka-Philipsen, Robert Pool, Richard A. Powell, Miel Ribbe, Katrin Sigurdardottir, Bart Van den Eynden, Paul Vanden Berge and Trudie van Iersel. They thank Susana Bento, Carolina Comabella, Filomena Ferreira, Grethe Iversen, Carmen López-Dóriga, Constanze Rémi, Christian Schulz and Wessex Translations for their work translating and back-translating the questionnaires. The invaluable work of Ron Irwin, Sian Best and Mike Gover at King’s College London is also highly appreciated. PRISMA aimed to provide evidence and guidance on best practice to ensure that research can measure and improve outcomes for patients and families. PRISMA activities aimed to reflect the preferences and cultural diversities of citizens, the clinical priorities of clinicians and appropriately measure multidimensional outcomes across settings where end of life care is delivered. Principal Investigator: Richard Harding, Scientific Director: Irene J Higginson. PRISMA members: Gwenda Albers, Barbara Antunes, Ana Barros Pinto, Claudia Bausewein, Dorothee Bechinger-English, Hamid Beniala, Emma Bennett, Lucy Bradley, Lucas Ceulemans, Barbara A Daveson, Luc Deliens, Noël Derycke, Martine de Vlieger, Let Dilien, Julia Downing, Michael Echteld, Natalie Evans, Dagny Faksvåg Haugen, Silvia Finetti, Nancy Gikaara, Barbara Gomes, Marjolein Gysels, Sue Hall, Richard Harding, Irene J Higginson, Stein Kaasa, Jonathan Koffman, Pedro Lopes Ferreira, Arantzaz Menaca, Johan Menten, Natalie Monteiro Calanzani, Fliss Murtagh, Bregje Ouwuteaka-Philipsen, Roeline Pasman, Francesca Pattentati, Robert Pool, Richard A. Funding

PRISMA was funded by the European Commission’s Seventh Framework Programme (Health-F2-2008-201655) with the overall aim to co-ordinate high-quality international research into end-of-life cancer care. The writing and analysis of this paper was also supported by project BuildCARE and the Cicely Saunders International. This document reflects the authors’ views and the European Commission is not liable for any use that may be made of the information contained here.

Conflicts of interest: None declared.

Key points

- In this study, we analysed open-ended survey question from seven European countries to identify European citizens’ views regarding end-of-life care in the face of serious illness.
- Results showed that the European public recognize the importance of death and dying, and they are concerned about the prioritization of quantity over quality of life. Also, they shared that palliative and end-of-life care access and quality needs to be improved in Europe.
- Four policy solutions are outlined for palliative and end-of-life care in Europe: institute government-led national strategies; protect regional research funding; consider within and between country variance; establish standards for training, education and service delivery.
- We have provided a model of how to use qualitative methods to achieve the integration of public concerns into both national and cross-national (regional) policy arenas.
