on 1 Mar 2013; 16:34 UT

Credential Certification: Jerome CHENEVEZ (jerome@space.dtu.dk)

Subjects: X-ray, Binary, Neutron Star, Transient

The neutron star X-ray transient MXB 1730-335, aka the Rapid Burster, has been detected in outburst by the JEM-X monitors onboard INTEGRAL during the Galactic Bulge monitoring (see ATel #438) observation performed on February 28th, 2013, between (UT) 14:28 and 18:10. It is detected at 25 σ in the combined JEM-X mosaic with an effective exposure time of 2 ksec, and the measured fluxes are the following:

170 \pm 6 mCrab (2.9e-9 erg/cm²/s) in the 3-10 keV energy band,

122 \pm 13 mCrab (1.5e-9 erg/cm²/s) in the 10-25 keV energy band.

The source is not visible in the IBIS/ISGRI camera with flux upper limits (6 σ) of \sim 3 mCrab (2.9e-11 erg/cm²/s) in the 18-40 keV band, and \sim 10 mCrab (1.0e-10 erg/cm²/s) in the 40-100 keV band.

No bursting activity is noticeable.

During the previous observation of the Galactic Bulge on February 24th (see ATel #4840) the source was not detected with 5 σ upper limits of 8 mCrab (1.1e-10 erg/cm²/s) and 5 mCrab (5e-11 erg/cm²/s) in the 3-10 keV and 10-25 keV bands, respectively. The last outburst we saw was in September 2011 (ATel #3646), but the Swift/BAT seems to have seen the source active last time in November 2012. The next INTEGRAL observation of the Galactic Bulge is planned for March 11th.
