Supplementary Information

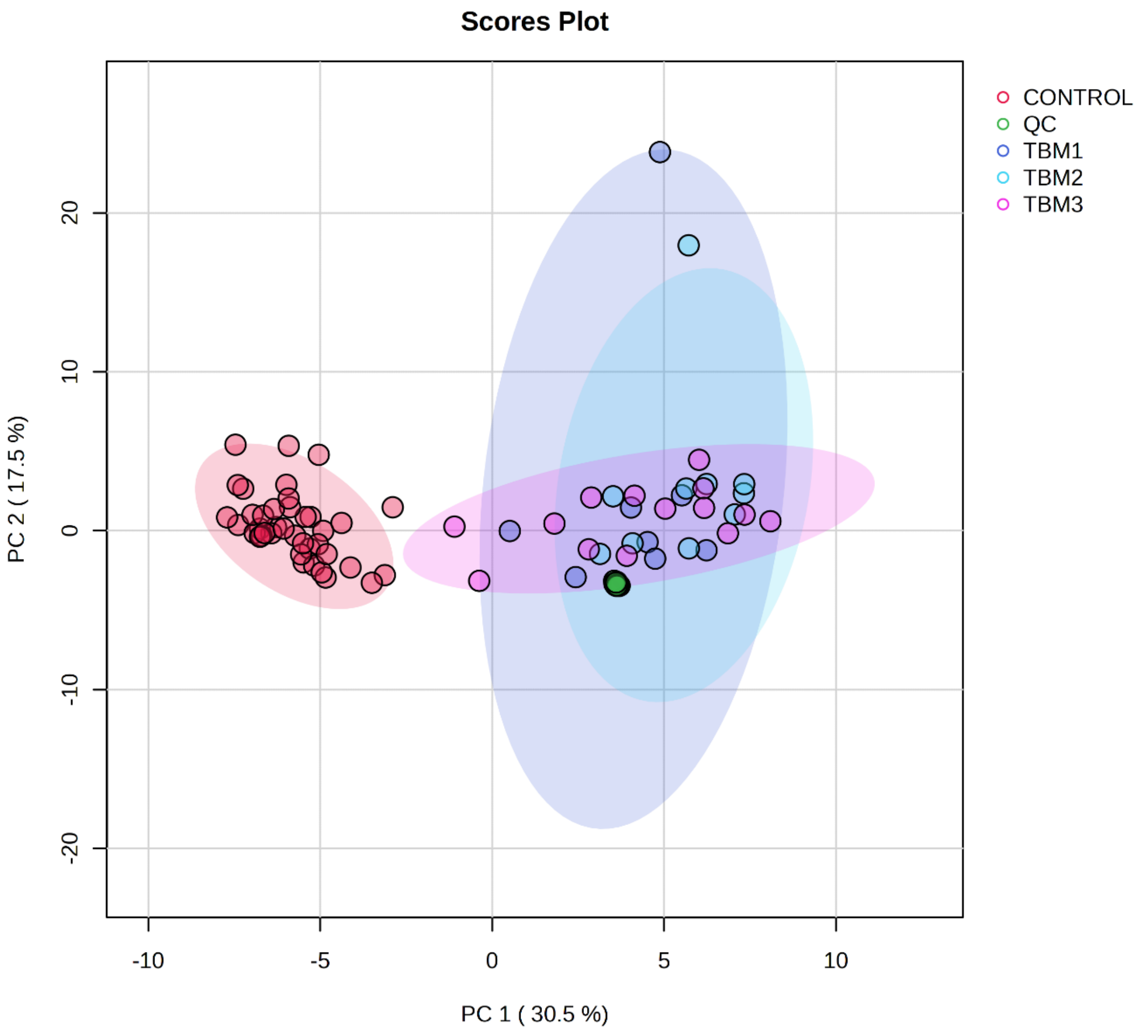

Figure S1: PCA scores plot of all patients and QC samples. The QC samples (green dots) clustered closely together, indicating that there was no discernible analytical drift during the course of all the ^{1}H-NMR analyses.

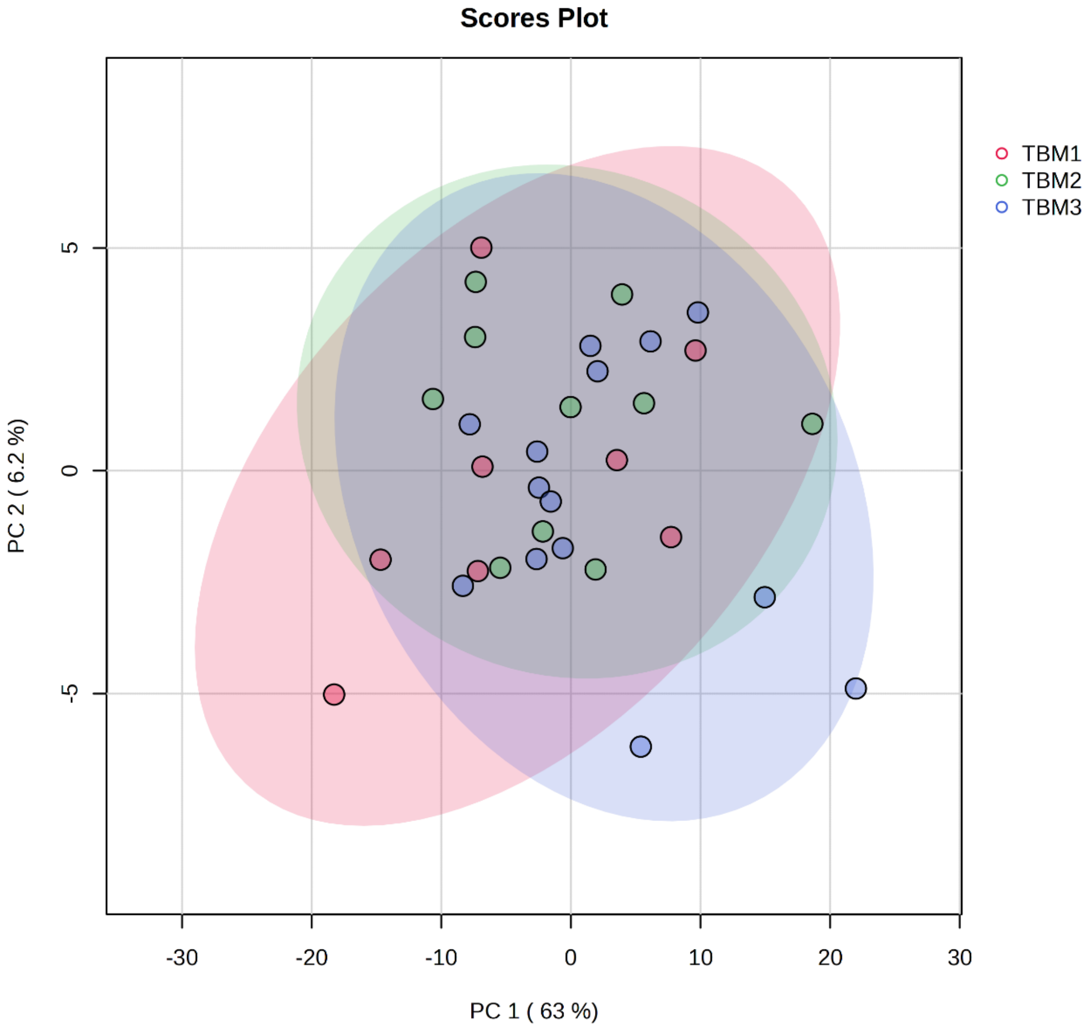

Figure S2: PCA scores plot of all the TBM stages showing no differentiation.

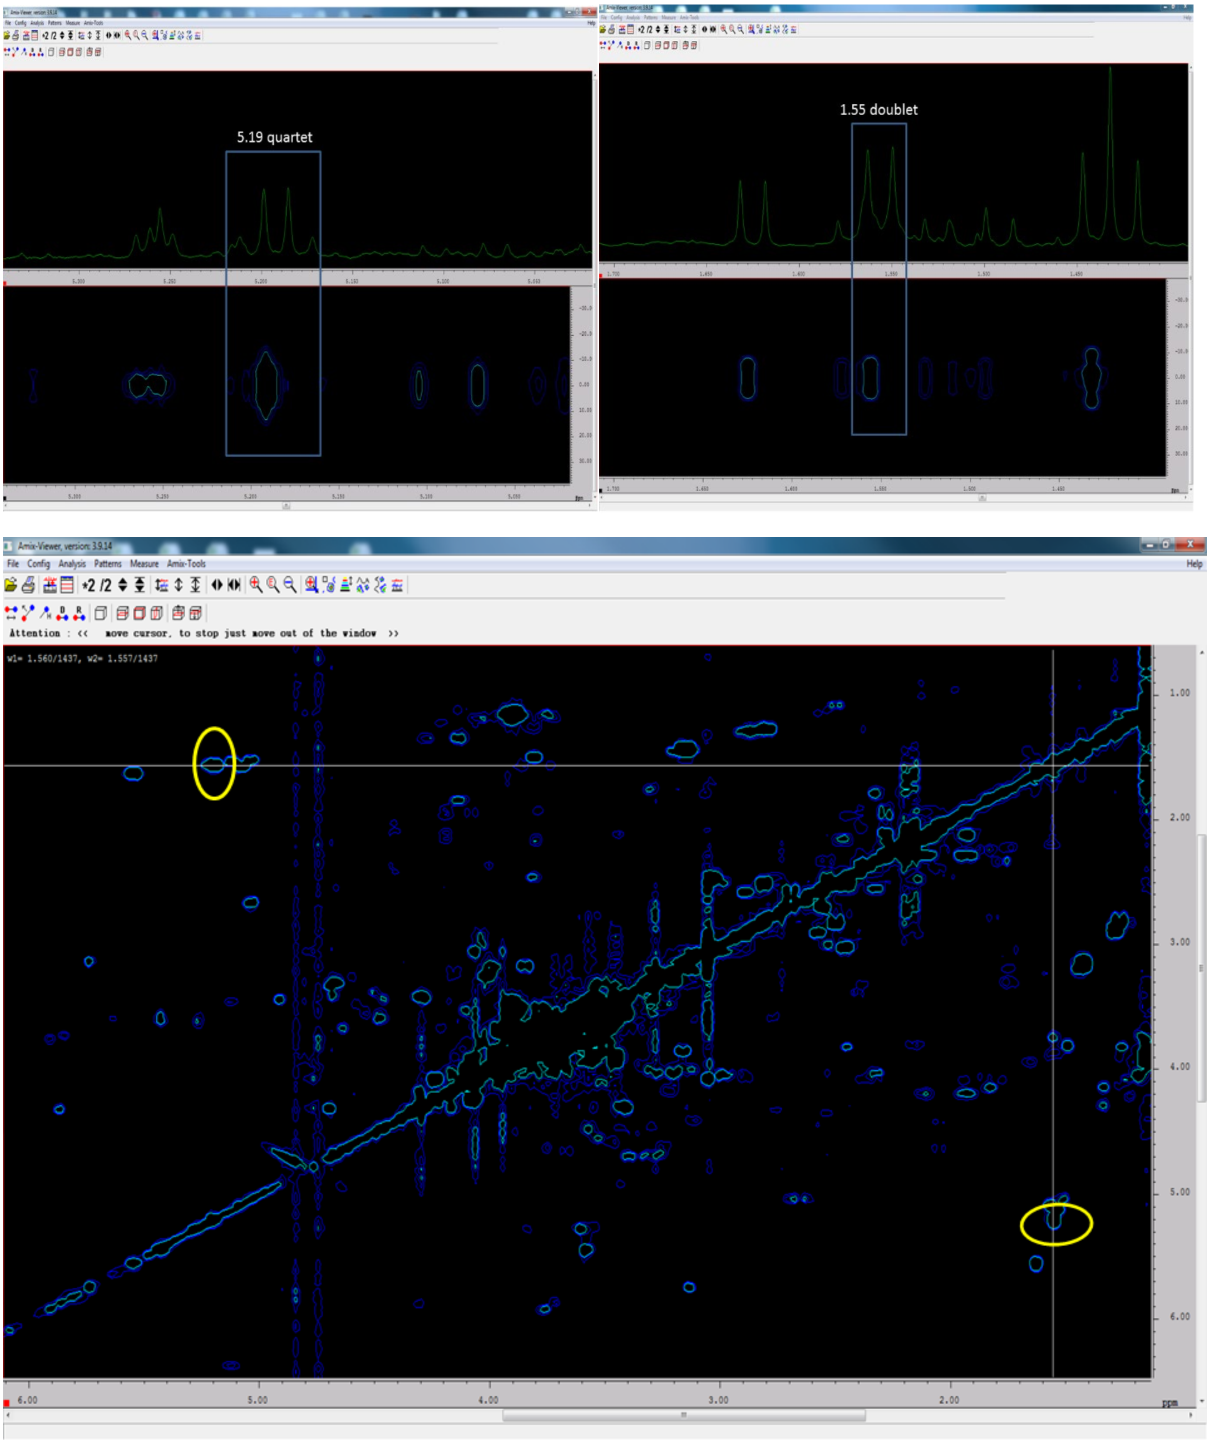

Figure S3: Above: 1D and 2D JRES NMR spectra showing a doublet at 1.55 ppm (above right) and quartet at 5.19 ppm (above left). Bottom 2D COSY NMR spectrum showing (yellow circles) that the doublet at 1.55 ppm and the quartet at 5.19 ppm are correlated (i.e., they are part of the same chemical compound).
