General experimental details

All reactions were carried out using standard Schlenk techniques under an atmosphere of dry nitrogen. Solvents were dried and distilled according to standard methods. Methyl benzoate was degassed and dried over 4Å molsieves. All other chemicals were purchased from commercial suppliers and used without further purification. The NMR spectra were recorded on Varian Mercury 300 MHz, Bruker DRX Avance 300 and Bruker AMX 400 MHz spectrometers. 19F NMR was used to confirm the (non-coordinating nature of the) BF₄⁻ anion (-152 ppm). ¹H-¹H COSY and/or ¹H-¹³C HSQC NMR spectroscopy was used to assign the signals of several compounds. High resolution mass spectrometry was performed on a Bruker MicrOTOF-Q (ESI⁺) GC analysis for esters was performed on a Thermo Scientific Trace GC Ultra equipped with a Restek RTX-200 column (30 m x 0.25 mm x 0.5 μm). Temperature program: Initial temperature 50 °C, hold for 4 min, heat to 130 °C with 30 °C/min, hold for 2 min, heat to 250 °C with 50 °C/min, hold for 9 min. Inlet temperature 200 °C, split ratio of 60, 1 mL/min carrier flow, FID temperature 250 °C. GC analysis for fatty esters and benzoic acid was performed on a Thermo Scientific Trace GC Ultra equipped with a Restek Stabilwax-DA column (30 m x 0.25 mm x 0.25 μm). Temperature program: initial temperature 40 °C, heat to 175 °C with 6 °C/min, heat to 250°C with 50 °C/min, hold for 18 minutes. Inlet temperature 280 °C, split ratio of 40, 1.5 mL/min carrier flow, FID temperature 250 °C. Conversion of trifluoroacetic acid and methyl trifluoroacetate were determined by ¹⁹F NMR spectroscopy using 1,3-bis(trifluoromethane)benzene as internal standard.

Synthesis procedures and NMR spectra of intermediate A, ligand L1, L2 and complexes 1-5

Synthesis of 3,3-(pyridine-2,6-diylbis(methylene))bis(4-para-tolyl-1,2,3-triazole); intermediate A. To a solution of 2,6-bis(bromomethyl)pyridine (397 mg, 1.5 mmol) in DMF/H₂O (7.5 mL, 4:1) was added NaN₃ (205 mg, 3.1 mmol), para-tolylacetylene (357 mg, 3.1 mmol), Na₂CO₃ (159 mg, 1.5 mmol), CuSO₄·5H₂O (150 mg, 0.6 mmol) and sodium ascorbate (238 mg, 1.2 mmol). The reaction mixture was stirred at room temperature for 16 h, after which the
suspension was poured into an EDTA/NH₄OH solution (100 mL, 0.5 M). CAUTION: The treatment with ammonium hydroxide before extraction is essential to avoid the possible formation of potentially explosive organic azides. The product was extracted with dichloromethane (3 x 15 mL) and washed with water (2 x 50 mL) and brine (50 mL). The organic phase was dried over MgSO₄ and concentrated in vacuo to yield the product as a white solid (480 mg, 1.1 mmol, 76%). ¹H NMR (300 MHz, CDCl₃) δ 7.85 (s, 2H, NCH₂), 7.75-7.65 (m, 6H, pyr-CH, Tol-CH), 7.22 (m, 8H, Pyr-CH, Tol-CH), 5.71 (s, 4H, CH₂), 2.40 (s, 6H, Tol-CH₃); ¹³C{¹H} NMR (75 MHz, CDCl₃) δ 155.0 (Cq), 139.0 (Pyr-CH), 138.3 (Cq), 136.1 (Cq), 129.8 (Tol-CH), 127.7 (Cq), 125.9 (Tol-CH), 122.2 (pyr-CH), 120.1 (tz-CH), 55.51(CH₂), 21.51 (CH₃). MS(El⁺) for C₂₅H₂₃N₇: m/z calculated 421.2009 [M⁺], observed 421.2013.

Synthesis of 3,3-[pyridine-2,6-diylbis(methylene)]bis(3-methyl-4-paratolyl-1,2,3-triazolium) bistetrafluoroborate; Ligand L1. Meerweins’ salt Me$_3$O.BF$_4$, 137 mg, 0.92 mmol) was added to a solution of intermediate A (155 mg, 0.37 mmol) in dichloromethane (10 mL) and the reaction mixture was stirred at room temperature for 16 h. A few drops of methanol were added to quench the reaction. The precipitate was collected on a glass frit and washed with small amounts of DCM and Et$_2$O, yielding the product as a white solid (185 mg, 0.30 mmol, 81%). $^1$H NMR (300 MHz, DMSO-$d_6$) $\delta$ 9.19 (s, 2H, NCH), 8.08 (t, $^3$J$_{HH}$ = 7.8 Hz, 1H, Pyr-CH), 7.70 (d, $^3$J$_{HH}$ = 7.8 Hz, 2H, Pyr-CH), 7.54 (d, $^3$J$_{HH}$ = 8.0 Hz, 4H, Tol-CH), 7.37 (d, $^3$J$_{HH}$ = 8.0 Hz, 4H, Tol-CH), 6.07 (s, 4H, CH$_2$), 4.22 (s, 6H, N-CH$_3$), 2.40 (s, 6H, Tol-CH$_3$); $^{13}$C($^1$H) NMR (75 MHz, acetonitrile-$d_3$) $\delta$ 152.6, 144.2, 143.4 (C$_q$), 140.7 (pyr-CH), 131.0, 130.1 (Tol-CH), 130.0 (tz-CH), 124.9 (Pyr-CH), 120.1 (C$_q$), 58.2 (CH$_2$), 39.6 (N-CH$_3$), 21.5 (CH$_3$). MS(CSI$^+$) for C$_{27}$H$_{29}$N$_2$BF$_4$: m/z calculated 538.2513 [M-BF$_4$]$^+$, observed 538.2482.

Synthesis of [Ag(CNC)]BF₄: 1. Ag₂O (87 mg, 0.3 mmol) was added to a solution of ligand L1 (95 mg, 0.15 mmol) in MeOH (10 mL) in a Schlenk flask charged with 4Å molsieves. The resulting suspension was stirred for 2 days at room temperature during which it changed color to pale grey/brown. The mixture was filtered over Celite (to obtain good yields the filtrate was thoroughly flushed with MeOH and acetone) and dried in vacuo yielding the product (87 mg, 0.13 mmol, 90%) as a pale yellow solid. The compound was stored under nitrogen and with exclusion of light. ¹H NMR (300 MHz, acetone-d₆) δ 7.93 (t, 3JHH = 7.7 Hz, 1H, Pyr-CH), 7.55 (d, 3JHH = 7.7 Hz, 2H, Pyr-CH), 7.47 (d, 3JHH = 7.8 Hz, 4H, Tol-CH), 7.23 (d, 3JHH = 7.8 Hz, 4H, Tol-CH), 5.84 (s, 4H, CH₂), 4.09 (s, 6H, N-C₃H₃), 2.44 (s, 6H, CH₃); ¹³C¹H NMR (75 MHz, acetone-d₆) δ 155.3, 149.8, 148.3, 140.8, 130.5, 129.9, 125.8 (Ar-C), 60.7 (CH₂), 37.9 (N-C₃H₃), 21.3 (CH₃). Catalytic ester hydrogenation experiments

General procedure for catalytic ester hydrogenation reactions: The catalyst (3.75 μmol), KOtBu (11 mg, 0.1 mmol for 20 mol%), Me₃NO (if applicable, 1.9 mg) and the substrate (if solid; 0.5 mmol) were weighed in a 4 mL GC-vial with a septum screw-cap charged with a stirring bar under an N₂ atmosphere. Subsequently, p-xylene (23.2 μL), the substrate (if liquid; 0.5 mmol) and THF (2 mL) were added. A needle was used to puncture the cap and a set of four vials was placed in a stainless steel autoclave (200 mL) under argon gas. The autoclave was flushed 2 times with 10 bar of H₂ and then pressurized to the desired pressure (5 or 50 bar), after which it was placed in a preheated oil bath (140 °C; built-in thermometer indicated 100 °C as the internal temperature of the autoclave). After allowing the autoclave to warm up (approximately 30 min.) the mixture was stirred for 2h after which the autoclave was cooled in an ice bath and the pressure was released. The conversions were determined by GC analysis as described in the general experimental details above.

Conditions: 0.5 mmol ester, 0.5 mol% of 2, 0.5 mol% of Me₃NO for entry 2-4, indicated amount of KOtBu and H₂ pressure in 1,4-dioxane at 100 °C for 2 hours. The yield and conversion was determined by GC analysis with p-xylene as internal standard.

NMR reactivity experiments

General procedure for deprotonation/dearomatization of complexes:

To a solution of the CNC complex (1 equiv.) in THD-d₈ was added KOtBu (1 equiv.) upon which an immediate color change to dark-red was observed. Low stability of the complexes prevented their isolation and full characterization.

Trimethylamine N-oxide (Me$_3$NO; 5 mg, 0.07 mmol) was added to a solution of complex 2 (10 mg, 0.01 mmol) was dissolved in CD$_2$Cl$_2$ (1 mL) under N$_2$ atmosphere and stirred for 18 hours. The resulting solution was characterized by NMR spectroscopy as is described above.

**NMR experiments under near-catalytic conditions:** Complex 5 (~20 mg) was dissolved in THF-d$_8$ (0.6 mL) and KOtBu was added (0, 10 or 20 equiv.) under nitrogen atmosphere. The mixture was transferred to a J.Young NMR pressure tube and pressurized with 5 bar H$_2$, after which a $^1$H NMR spectrum was recorded. The tube was subsequently heated in an oil bath at 100 °C for two hours and analyzed by multinuclear NMR spectroscopy at room temperature.
DFT investigation *fac/mer* coordination of CNC ligand

Most lutidine-based pincer complexes, including those with more flexible six-membered chelate rings, adopt a meridional (*mer*) conformation.\(^1\) However, a recent DFT and experimental study has shown that for [Ru(PNP)(PhCOO)]\(_2\) the *fac* coordination mode was significantly more stable (yet inactive in direct insertion of CO\(_2\) into the C-H bonds of arenes).\(^2\) To gain insight in the reason for *fac* coordination in our case, we performed DFT calculations. The *mer* conformation turned out to be more thermodynamically favorable by 2.2 kcal/mol at the BP86/def2-TZVP level (Figure S1). This points to the *fac* configuration being the kinetic product, produced by these specific reaction conditions. Attempts to obtain the *mer* analogue synthetically have not been successful to date (combinations of various bases mentioned above or Ag(І) complex 4 and several ruthenium precursors \([[(RuCl_2(MeCN))_4], [(RuCl(CO)(H)(PPh_3))_3], [(RuCl_2(PPh_3))_4] and [(Ru(p-cym)(CO)Cl_2)]\) in various solvents (THF/DCM/MeCN) and temperatures (25-70 °C).\(^3,4\)
