Interferon Gamma Release Assays for Tuberculosis and their potential as efficacy markers for intervention trials

CONTENTS

Chapter 1  General Introduction

Chapter 3  Commercial interferon gamma release assays compared to the tuberculin skin test for diagnosis of latent Mycobacterium tuberculosis infection in childhood contacts in the Gambia.

Chapter 4  Sensitivity of commercial interferon gamma release assays for Tuberculosis in high incidence settings-does the infecting Mycobacterial strain matter?

Chapter 5  Evaluation of the contribution of major T cell subsets to IFN-gamma production in TB infection by ELISPOT.

Chapter 6  Rising ELISPOT count prior to the onset of symptoms of full-blown Tuberculosis disease.

Chapter 7  Decay kinetics of an interferon gamma release assay with anti-tuberculosis therapy in newly diagnosed tuberculosis cases.

Chapter 8  Interferon gamma ELISPOT as a Biomarker of Treatment Efficacy in Latent Tuberculosis Infection: a Randomized, Blinded and Placebo Controlled Clinical Trial.
Chapter 9  General Discussion

Chapter 10  Summary
