List of Tables

Table 2-1: Total average of 16 year-olds per zip in the four major cities, and average number and percentage of 16 year-old Moroccan Dutch among this group 27

Table 2-2: Regression coefficients of the percentage enrolments in academic tracks among 16 year-old Moroccans on the share of Moroccan 16 year olds at zip-code level 30

Table 2-3: Correlation of the percentage of 16 year-old Moroccans per zip, and the percentage among them in secondary academic tracks, for all zips and for zips at risk separately 31

Table 2-4: Correlations between total percentage of all immigrants per zip- and the percentage of 16 year-old Moroccans in secondary academic tracks, separately for the four major cities. 32

Table 3-1: Composition by ethnicity of all 16-22 year-olds living in zip-code areas 1061, 1062 and 1063 in the district Amsterdam-West, at the reference date of 31 July 2009 53
Table 3-2: The share of 16-22 year-olds by ethnicity, enrolled in academic secondary tracks. Individuals were registered at least once in the data file as being enrolled at this level.

Table 3-3: The number of secondary schools attended by 16-22 year-olds, by ethnicity.

Table 3-4: The number of secondary schools attended by 16-22 year-olds, by ethnicity, measuring school switching that includes cluster switching.

Table 3-5: Categories of school-exit among pupils of Moroccan descent, who were enrolled in academic secondary tracks (reference date 31 July 2009).

Table 3-6: School switching among pupils in Amsterdam enrolled in the Year 3 of secondary education in 2011.

Table 3-7: School switching among pupils living in zip-codes 1061, 1062 and 1063, enrolled in the Year 3 of secondary education in 2011.

Table 3-8: Cluster switching among pupils in Amsterdam enrolled in Year 3 of secondary education in 2011.

Table 3-9: Cluster switching among pupils living in zip-codes 1061, 1062 and 1063 enrolled in Year 3 of secondary education in 2011.

Table 3-10: Comparison of track level at entry and in Year 3 of secondary school, separate for school switchers and non-switchers, among pupils in Amsterdam.

Table 3-11: Comparison of the track level at entry- and in Year 3 of secondary school, separate for school switchers and non-switchers, among pupils in zip-code areas 1061, 1062 and 1063.

Table 3-12: Comparison of track level at entry- and in Year 3 of secondary school, separately for school switchers and non-switchers, among pupils of Moroccan descent in Amsterdam.

Table 3-13: Comparison of track level at entry- and in Year 3 of secondary school, separately for school switchers and non-switchers, among pupils of Moroccan descent in zip-code areas 1061, 1062 and 1063.

Table 4-1: Summary statistics for pupils living in the four major Dutch cities, at the individual, neighbourhood and school level.
Table 4-2: Regression results (OLS) for distance to secondary school in km, on individual-, school- and neighbourhood variables (standard errors in parentheses).

Table 4-3: Summary statistics of the comparison between the group of students who choose the nearest relevant school (i.e. a school that indeed offers a desired track) to their home, and those who do not (standard deviations in parentheses)

Table 4-4: Regression results (OLS) for choosing the nearest school (i.e. comparing pupils who choose the nearest school with those who choose another school), with choosing the nearest school = 1

Table 4-5: Regression results (OLS) for the distance difference (i.e. between the actual and the nearest school), with distance difference = 0 for pupils who choose the nearest school

Table 4-6: Comparisons of nearest (non-chosen) school and the actual school, considering non-nearest school choosers only (14247 individuals, 88.7 % of the data set)

Table 4-7: Regression results (OLS) for SES difference (i.e. average SES of chosen school minus average SES of nearest school), considering non-nearest school choosers only (14197 individuals)

Table 4-8: Regression results (OLS) for the difference in the percentage of pupils with a non-Western migrant background (i.e. percentage at the actual school minus the percentage at the nearest school), considering non-nearest school choosers only (14197 individuals)

Table 4-9: OLS regressions of individual upward mobility at the entrance of Year 3, considering only pupils who started at the lower vocational secondary level in Year 1 (4343 individuals); non-nearest school choosers only

Table 5-1: All school questions clustered in five domains, plus matches with selected scientific publications and the nature of every publication.
Table 5-2: Categories of selected research publications, per cluster of questions. (Note that the same publication may be suggested to several schools; e.g. 5 meta-review studies were matched 15 times with a school question).

Table 5-3: Overview of the outcomes of the evaluative interview. Schools A, B, and E had an extra intermediate exploratory discussion.

Table 5-4: Application (after Johnson, 1998) of research outcomes by school leaders after three months.
