LIST OF FIGURES

Figure 0.1	Conceptualizing micro-macro relations in transportation and residential choice modeling	xi
Figure 2.1	Multinomial choice structure for a decision-making entity n	15
Figure 2.2	Nested choice structure for a given decision-making entity n .	19
Figure 4.1	Null clines solution of system for parameter values of β showing bifurcations	45
Figure 4.2	Null clines solutions of system for parameter values of β showing bifurcations	50
Figure 4.3	Potential function and null clines solution of the sociodynamic trinary multinomial logit model	54
Figure 4.4	Potential function and null clines solution of the sociodynamic trinary multinomial logit model, continued	55
Figure 4.5	Potential function and null clines solution of the sociodynamic trinary multinomial logit model, continued	56
Figure 4.6	Solution trajectory in the (p_0, p_1) -plane for the sociodynamic trinary multinomial logit model	57
Figure 4.7	Bifurcation diagram for the sociodynamic trinary multinomial logit model	58
Figure 5.1	Depiction of the nesting structure of a trinary discrete choice model	64
Figure 5.2	Null clines solution of planar system with $\mu_L = 2; \beta = 1$	68
Figure 5.3	Computationally-derived bifurcation curves in the (β, μ_L) -plane	74
Figure 5.4	Detail of bifurcation curves at interesting region in parameter space	75
Figure 5.5	Example null clines solution of system in each of the major regimes	76
Figure 5.6	Null clines in major regimes in parameter space	77
Figure 5.7	Null clines in major regimes in parameter space, continued	78
Figure 5.8	Competing terms in the “potential” function G	87

Figure 5.9	Example potential function in Regime I	89
Figure 5.10	Example potential function in each of the major regimes	90
Figure 5.11	Example potential functions in the limit $\mu_L \rightarrow \infty$	94
Figure 5.12	Bifurcation curves in the (β, μ_L) -plane	100
Figure 5.13	Null clines solutions of the sociodynamic trinary nested logit model with estimated coefficients	105
Figure 5.14	Null clines solutions in Regime II, VII, I	107
Figure 5.15	Solution surface for the solution $p_1 = p_2$ of the sociodynamic trinary nested logit model	111
Figure 5.16	Detail of the solution surface for the solution $p_1 = p_2$	111
Figure 5.17	Allowed steady-state values of $p_1 = p_2$, and the parameter β	114
Figure 5.18	Bifurcation diagrams for the solution $p_1 = p_2$ of the trinary nested logit model	118
Figure 5.19	Detail of 3D solution surface at hysteresis region	122
Figure 5.20	Projection onto (β, p_1) -plane of 3D solution surface detail	123
Figure 5.21	Projection onto (β, μ_L) -plane of 3D solution surface detail	123
Figure 5.22	Graphical solution of value of $p_1 = p_2$ at $\mu_L = 1$ on the cusp bifurcation	126
Figure 5.23	Graphical solution of value of $p_1 = p_2$ as $\mu_L \rightarrow \infty$ on the cusp bifurcation	128
Figure 5.24	Bifurcation cusp in (β, μ_L) -parameter space satisfying $\partial g_0 / \partial p_0 = 0$	131
Figure 5.25	Bifurcation curve in (β, μ_L) -parameter space satisfying $\partial g_1 / \partial p_1 = 0$	133
Figure 5.26	Graphical solution of global lower limit of μ_L for pitchfork bifurcation	136
Figure 5.27	Null clines solution of system at values of β satisfying $\det J = 0$	149
Figure 5.28	Null clines solution of system at values of β satisfying $\det J = 0$, continued	150
Figure 5.29	Null clines solution of system at values of β satisfying $\det J = 0$, continued	151
Figure 5.30	Null clines solution of system at values of β satisfying $\det J = 0$, for large μ_L	152
Figure 5.31	Example solution trajectory over β with $p_1 \neq p_2$ and null cline for $\det J$	153

- Figure 5.32 Detail of solution trajectory over β with $p_1 \neq p_2$ and null cline for $\det \mathbf{J}$ 153
- Figure 5.33 Bifurcation trajectory in the (p_0, p_1) -plane over all β and all μ_L 154
- Figure 5.34 Bifurcation curve in the (β, μ_L) -plane satisfying $\det \mathbf{J} = 0$ for $p_1 \neq p_2$ 155
- Figure 5.35 Analytically-derived bifurcation curves in the (β, μ_L) -plane 165
- Figure 5.36 Solution trajectories in the (p_0, p_1) -plane over β for selected values of μ_L 166
- Figure 5.37 General bifurcation diagrams for the sociodynamic trinary nested logit model 167
- Figure 5.38 General bifurcation diagrams for the sociodynamic trinary nested logit model, continued 168
- Figure 5.39 General bifurcation diagrams for the sociodynamic trinary nested logit model, continued 169
- Figure 5.40 Detail of bifurcation diagrams for p_1 versus β near the hysteresis region 170
- Figure 6.1 Plotted graphs of $y = \varphi$ and $y = \tanh(1/2)\beta\varphi$ 182
- Figure 6.2 The working of a single simulation run for a fully connected network with global social influence 183

- Figure 6.5 Histograms of $f(x) = x$ after 2000 iterations over 500 simulation runs 185
- Figure 6.6 The working of a single simulation run for a network with heterogeneous local social influence 188
- Figure 6.7 The parameter sweep (response surface analysis) for a set of simulations with heterogeneous local social influence on an Erdős-Rényi random network 189
- Figure 6.8 Histograms of $f(x) = x$ after 2000 iterations over 500 runs with 100 agents in an Erdős-Rényi network 191

- Figure 6.9 The parameter sweep (response surface analysis) for a set of simulations with heterogeneous local social influence on a Watts-Strogatz network 192
- Figure 6.10 The effect of rewiring w and decreasing average path length l in histograms of $f(x) = x$ after 2000 iterations over 500 runs with 100 agents in a Watts-Strogatz network 193
- Figure 6.11 The working of a single simulation run for a network with heterogeneous local social influence, node characteristics and choice attributes per node 196
- Figure 6.12 The parameter sweep (response surface analysis) for a set of simulations with heterogeneous local social influence, node characteristics and choice attributes on an Erdős-Rényi random network 198
- Figure 6.13 Selected aggregated histograms for a sweep of network density $p = 0.005$ to $p = 0.9$ for four model specifications with and without an alternative specific constant and with and without self loops 200
- Figure 6.14 Selected detailed histograms for four Erdős-Rényi network instantiations with different network generator random seeds at network density p , for the model specification with an alternative specific constant and with self loops 201
- Figure 6.15 Plotted graphs of $y = \varphi$ and $y = \tanh(1/2)[\beta_{xn} + h + \gamma'S_n + \zeta'z_n]$ versus φ 202
- Figure 6.16 Plotted graphs of $y = \varphi$ and $y = \tanh(1/2)[\beta_{xn} + h + \gamma'S_n + \zeta'z_n]$ versus φ 203
- Figure 6.17 Estimated coefficient values for four model specifications with and without an alternative specific constant, and with and without self loops 205
- Figure 6.18 The parameter sweep (response surface analysis) for a set of simulations with heterogeneous local social influence, node characteristics and choice attributes on an Erdős-Rényi random network 207

- Figure 6.19 Selected aggregated histograms with constrained coefficients for a sweep of network density $p = 0.005$ to $p = 0.1$ for the model specification with an alternative specific constant and with self loops 208
- Figure 6.20 Ensembles of plots for 20 network instantiations depicting the envelope of values of estimated local interaction coefficient versus network density, for models with an alternative specific constant, with and without self loops 209
- Figure 6.21 Ensembles of plots for 20 network instantiations depicting the envelope of values for the correlation between local interaction coefficient and alternative specific constant, versus network density, for models with an alternative specific constant, with and without self loops 209
- Figure 6.22 Ensembles of plots for 20 network instantiations depicting the envelope of values for rho-squared (model fit) versus network density 210
- Figure 7.1 Primary residential locations (known to precision of a TAZ centroid) of respondents sampled by the DIVV in the period 1992-1997 making direct home-work or direct work-home trips – indicated with commuter mode choice. 224
- Figure 7.2 Transportation network in Amsterdam and immediate environs. 225
- Figure 7.3 Histograms of total travel time by bicycle for direct-commuting respondents choosing bicycle or moped/motorcycle 236
- Figure 7.4 Depiction of the nesting structure of a trinary discrete choice model with unobserved heterogeneity that is shared between public transit and car driver/passenger mode alternatives 243
- Figure 7.5 Example time series with different random seeds for a benchmark sociodynamic trinary nested logit model with only a generic global field variable in the systematic utility for each mode 245
- Figure 7.6 Transportation mode count for commuters in the sample grouped by residential district. 247

- Figure 7.7 Abstract visualization of network interdependence defined by residential district plus socioeconomic group 251
- Figure 7.8 Depiction of the nesting structure of a trinary discrete choice model with unobserved heterogeneity that is shared between public transit and bicycle/motorcycle/moped mode alternatives 253
- Figure 7.9 Example time series with different random seeds for a sociodynamic trinary multinomial logit model with fully specified systematic utility for each mode and empirically defined local field variable 257
- Figure 7.10 Example time series with different random seeds for a sociodynamic trinary nested logit model with fully specified systematic utility for each mode and empirically defined local field variable 259
- Figure 7.11 The working of a single simulation run 261
- Figure 7.12 Example time series for benchmark sociodynamic models on a fully connected network under different initial conditions 262
- Figure 7.13 Observed long-run mode shares with different random seeds for benchmark sociodynamic models on a fully connected network under different initial conditions 263
- Figure 7.14 Visualization of analytical solutions on a potential surface 265
- Figure 7.15 Example time series for the benchmark sociodynamic nested logit model on fully connected extracted subsets of the sample with different sizes 269
- Figure 7.16 Observed mode shares with different random seeds for the benchmark sociodynamic nested logit model on fully connected extracted subsets of the sample with different sizes 270
- Figure 7.17 Example time series for the benchmark sociodynamic nested logit model on different socio-geographic networks 275
- Figure 7.18 Observed long-run mode shares with different random seeds for the benchmark sociodynamic nested logit model on different socio-geographic networks 276

- Figure 7.19 Example time series for the benchmark sociodynamic nested logit model on different socio-geographic networks with initial equal mode shares 279
- Figure 7.20 Observed long-run mode shares with different random seed for the benchmark sociodynamic nested logit model on different socio-geographic networks with initial equal mode shares 280
- Figure 7.21 Abstract visualization of separate clustered groups and overlapping groups 285
- Figure 7.22 Observed long-run mode shares with different random seeds for fully specified sociodynamic nested logit models on different socio-geographic networks 290
- Figure 7.23 Observed long-run mode shares with different random seeds for hypothetical experiment with sociodynamic nested logit models where estimated utility parameters and socio-geographic networks are swapped 292
- Figure A.1 Bifurcation diagram for the sociodynamic binary logit model 356
- Figure B.1 Solution surface for the sociodynamic binary logit model with constant bias 363
- Figure B.2 Bifurcation diagrams for sociodynamic binary model with alternative specific constant 365
- Figure B.3 Bifurcation curves in the (β, h) -plane 368
- Figure C.1 Computationally-derived bifurcation curves in the (β, h) -plane 375
- Figure C.2 Example null clines solution in major regimes in parameter space 376
- Figure C.3 Example null clines solution in major regimes in parameter space, continued 377
- Figure C.4 Bifurcation curves in the (β, h) -plane 378
- Figure C.5 Bifurcation diagrams for the special solution of the sociodynamic trinary multinomial logit model where the mode shares of the unbiased alternatives are equal 381
- Figure C.6 Bifurcation diagrams for the special solution of the sociodynamic trinary multinomial logit model where the mode shares of the unbiased alternatives are equal, continued 382
- Figure C.7 Bifurcation cusp in (β, h) -parameter space 384
- Figure C.8 Bifurcation curve in (β, h) -parameter space satisfying $\partial g_1 / \partial p_1 = 0$ 389

- Figure C.9 Null clines solution of system for parameter values of β showing bifurcations 395
- Figure C.10 Null clines solution of system for parameter values of β showing bifurcations, continued 396
- Figure C.11 Null clines solution of system for parameter values of β showing bifurcations, continued 397
- Figure C.12 Null clines solution of system for parameter values of β showing bifurcations, continued 398
- Figure C.13 Solution trajectory over β and null clines for $\det \mathbf{J}$ for the sociodynamic trinary multinomial logit model with $h = 0$ (no bias) 399
- Figure C.14 Example solution trajectory over β and null clines for $\det \mathbf{J}$ over a sweep of parameter $h > 0$ 400
- Figure C.15 Example solution trajectory over β and null clines for $\det \mathbf{J}$ over a sweep of parameter $h < 0$ 401
- Figure C.16 Bifurcation trajectory in the (p_0, p_1) -plane over all β and all h 402
- Figure C.17 Bifurcation curve in the (β, h) -plane satisfying $\det \mathbf{J} = 0$ for $p_1 \neq p_2$ 402
- Figure C.18 Example potential functions for the sociodynamic trinary multinomial logit model with constant bias 405
