ACKNOWLEDGMENTS

Many people have contributed to making this work possible, and I am greatly indebted to them all. Most likely there were many more than I can mention here — I apologize to all those wonderful people I am forgetting. Thank you all!

First of all I would like to thank my supervisors, Robert Spreeuw and Ben van Linden van den Heuvel for giving me the opportunity to work on this project. I have learned a lot from both of you in the last years, greatly enjoyed my time working in your group, and hope there is a very bright future ahead for the Amsterdam Atom Chip.

A series of postdocs has supported me in this endeavour. Shannon Whitlock as the first of those made me feel very welcome when I joined the group and taught me everything I could possibly want to know about the experiment. It was great working with you, Shannon. Next up was Vanessa Leung — without her the current chip would not exist, and her silly walk certainly deserves that government grant! Finally we were joined by Lara Torralbo-Campo at a time when I was already moving away from the lab and onto writing, and she took over in the lab admirably. In the final results presented in the last chapter of this thesis the work of all three of these can be seen: Shannon, who played a crucial role in the design of the chip, Vanessa, who took over production, and Lara without whom we might still not have any atoms loaded in the microtraps.

My journey was accompanied by a large number of other PhD students in the group and in the institute, including Paul Cleary, Jan-Joris van Es, Aaldert van Amerongen and Carolijn van Ditzhuizen. I took over the experiment of René Gerritsma, who had left in in a brilliant and well-maintained state for me. For the first two years I shared a lab with Philipp Wicke which was an excellent experience. The barbecues on the balcony of Antje Ludewig were always very enjoyable and relaxing events — as was her traditional Feuerzangenbowle!

In the last year of my time here the number of PhD students directly connected to the atom chip experiment increased tremendously, and I was joined by Arthur La Rooij (UvA buerauacracy-mangler extraordinaire), Maarten Soudijn (the first person to actually get atoms into our microtraps) and Julian Naber (who took over my favourite pet project with great results). I hope you guys will have a great time together, and I wish you all lots of luck with your experiments.

Last of the PhD students is Richard Newell, longest of all my companions, who took over the experiment I did my MSc. research on, and later joined me for a bit of fun with thermal Rydberg atoms in a vapour cell. I hope you’ll soon be writing the acknowledgements for your own thesis!
Many a Bachelor and Master student has passed by in the last years, and they have all done a brilliant job keeping things running and injecting fresh ideas to the experiment. First of them were Rutger Thijssen, who did a tremendous job setting up the Rydberg laser system and Caspar Ockeloen, brilliant lab wizard in lots of things. The project of Jasper Reinders kickstarted the calculations on the fidelity of absorption imaging. Daniël Pijn and Gijs Mulder are the most steady of students, and it feels like they are part of the setup by now. Thank you guys for all the great work you did! By now there are many more, and I can not mention them all, but wish you all the best of luck with your experiments.

There are many more people who have made life good in and around the Quantum Gases & Quantum Information group, and Klaasjan van Druten, Jook Walraven, Tom Hijmans, Wojciech Lewoczko-Adamczyk, Quentin Beauvils, Steven Poutre and Frederik Spiegelhalder should not go without mention here.

None of the results presented here would have been possible without technical support. First and foremost I would like to thank Hugo Schlatter, who did a brilliant job in the construction of everything surrounding the chip. Without Piet Sannes and Taco Walstra the move from Roeterseiland to Science Park would have been an utter nightmare, not to mention all the other things they have done for me. Hans Agema is our local wizard of rf-electronics, and Mattijs Bakker draws things faster than I can follow. More thanks go to Huib Luigjes, Ron Manuputy, Hans Ellermeijer, Eric Hennes, Udo van Hes, Cees van den Biggelaar, Harry Beukers, Wim van Aartsen, Fred van Anrooij, Wietse Buster, Tjerk van Goudoever, Jan Kalwij, Farah Kuckulus, Diederick Kwakkestijn, Ben Klein-Meulekamp, Henk Luijten, Joost Overtoom, Jur Pluim, Johan Soede, Daan de Zwarte, Theo van Lieshout, Herman Prins, Johan te Winkel, Edwin Baay, Frans Pinkse, Alof Wassink, Ed de Water, Hans Gerritsen, Gerrit Hardeman, Ben Harrison and Bert Zwart.

I would further like to thank Rita Vining, Ineke Baas, Natalie Wells, Anne-Marieke Crommentuijn, Luuk Lusink and Joost van Mameren for lots of help with all the administrative things one can possibly imagine needing help with.

Last but most certainly not least I would like to thank my family. My parents, who supported me wherever I went, but most of all my son Piak, my daughter Målin and my wife Ela, who gracefully suffered through my absences, through the stress and the long nights that come with writing a thesis, and did everything in their power to make things easier for me. Thank you.
