You will be contacted as soon as possible.
## Contents

1. Introduction
   1.1 Motivation
   1.2 Terminology of computational modelling
      1.2.1 Model building
      1.2.2 Model use
   1.3 Thesis aims
   1.4 Thesis set-up

2. Background
   2.1 Introduction
   2.2 Hydrodynamics: flow around a static gate
      2.2.1 General description
      2.2.2 Turbulence
      2.2.3 Hydrodynamic forces on a static underflow gate
      2.2.4 Navier-Stokes equations
   2.3 Linear vibrations
      2.3.1 Basic theory
      2.3.2 Frequency domain
   2.4 Physics of flow-induced gate vibrations
      2.4.1 Introduction to flow-induced vibrations
      2.4.2 Dimensionless parameters
      2.4.3 Causes of flow-induced gate vibrations
      2.4.4 Added coefficients
      2.4.5 Consequences of gate vibrations
      2.4.6 Myths about gate vibrations
   2.5 Generalisation and problem solving in practice
   2.6 Conclusions from the physical description

3. Physics-based numerical modelling
   3.1 Introduction
   3.2 Applying CFD for problem solving in hydraulic engineering
   3.3 Setting up a FIV model
      3.3.1 Finite element method
      3.3.2 Turbulence modelling
3.3.3 The arbitrary Lagrangian-Eulerian mesh .................................................. 50
4 Multi-scale model for discharge control and flow impact ................................... 55
  4.1 Introduction ....................................................................................................... 55
  4.2 Approach and method ..................................................................................... 56
    4.2.1 General ........................................................................................................ 56
    4.2.2 Configurations of multi-gated structure ....................................................... 57
    4.2.3 System model and gate control ................................................................. 58
    4.2.4 Discharge model ....................................................................................... 61
  4.3 CFD simulations ............................................................................................. 64
    4.3.1 Model set-up .............................................................................................. 64
    4.3.2 Analysis of simulation output: flow impact .............................................. 66
  4.4 Model validation ............................................................................................. 67
  4.5 Results of test case simulations ................................................................. 69
    4.5.1 Results of system and discharge model .................................................. 69
    4.5.2 Results of CFD simulations .................................................................. 72
    4.5.3 Results of flow analysis ........................................................................... 74
  4.6 Model coupling tests ..................................................................................... 76
  4.7 Conclusions of this chapter ......................................................................... 78
5 Physical experiment ............................................................................................ 79
  5.1 Preface ........................................................................................................... 79
  5.2 Introduction ..................................................................................................... 79
  5.3 Experimental set-up ....................................................................................... 81
  5.4 Definitions ...................................................................................................... 86
  5.5 Measurement conditions and variation of parameters ............................... 87
  5.6 Results of physical experiment ................................................................. 88
  5.7 Comparison with other experimental results .............................................. 91
  5.8 Summary ....................................................................................................... 91
  5.9 Photographs from the experiment .............................................................. 91
6 Numerical simulation study of gate vibration .................................................. 97
  6.1 Introduction ..................................................................................................... 97
  6.2 Model set-up .................................................................................................. 97
  6.3 Selected cases and model validation ............................................................ 100
    6.3.1 Added mass validation ............................................................................ 100
