Determination of the Ratio of $b$-Quark Fragmentation Fractions $f_s/f_d$

in $pp$ Collisions at $\sqrt{s} = 7$ TeV with the ATLAS Detector

G. Aad et al.*

(Received 3 August 2015; published 30 December 2015)

With an integrated luminosity of 2.47 fb$^{-1}$ recorded by the ATLAS experiment at the LHC, the exclusive decays $B^0_s \rightarrow J/\psi K^0$ and $B^0_d \rightarrow J/\psi K^0$ of $B$ mesons produced in $pp$ collisions at $\sqrt{s} = 7$ TeV are used to determine the ratio of fragmentation fractions $f_s/f_d$. From the observed $B^0_s \rightarrow J/\psi \phi$ and $B^0_d \rightarrow J/\psi K^0$ yields, the quantity $(f_s/f_d) [B(B^0_s \rightarrow J/\psi \phi) / B(B^0_d \rightarrow J/\psi K^0)]$ is measured to be $0.199 \pm 0.004$ (stat) $\pm 0.008$ (syst). Using a recent theory prediction for $[B(B^0_s \rightarrow J/\psi \phi) / B(B^0_d \rightarrow J/\psi K^0)]$ yields $(f_s/f_d) = 0.240 \pm 0.004$ (stat) $\pm 0.010$ (syst) $\pm 0.017$ (th). This result is based on a new approach that provides a significant improvement of the world average.

The production rate of $B^0_s$ ($B^0_d$) mesons is a product of the $b\bar{b}$ cross production, the instantaneous luminosity and the probability that the $\bar{b}$ quark is bound to an $s$ ($d$) quark. The latter, denoted by the fragmentation fraction $f_s$ ($f_d$), depends on the probability that in pQCD-inspired calculations [1,2], a soft gluon splits into $s\bar{s}$ ($d\bar{d}$) and that the overlap of the $\bar{b}$ and $s$($d$) wave functions is sufficiently large to produce a $B^0_s$ ($B^0_d$) bound state. In a similar fashion, $B^+$ mesons, $B^0$ mesons, and $b$ baryons are produced at the LHC with respective fragmentation fractions $f_u$, $f_c$, and $f_{\text{baryon}}$. The fragmentation fractions are about 40% each for $u$ and $d$ quarks, 10% for $s$ quarks, at the percent level for $c$ quarks, and $\sim 8\%$ for baryon production satisfying the constraint $f_u + f_d + f_s + f_c + f_{\text{baryon}} = 1$. Precise knowledge of the fragmentation fractions is essential for measuring $b$-hadron cross sections and branching fractions at the LHC. In particular, for rare decays, such as the branching fraction measurement of $B^0_s \rightarrow \mu^+\mu^-$ [3–5], a precise knowledge of $f_s/f_d$ is important since it improves the sensitivity of searches for new physics processes beyond the standard model (SM). The fragmentation ratio $f_s/f_d$ is a universal quantity that was measured by LEPI experiments [6], CDF [7], and LHCB [8,9]. This Letter presents a measurement of $f_s/f_d$ using $B^0_s \rightarrow J/\psi \phi$ and $B^0_d \rightarrow J/\psi K^0$ decays.

The ratio of fragmentation fractions $f_s/f_d$ is extracted from the measured $B^0_s \rightarrow J/\psi \phi$ and $B^0_d \rightarrow J/\psi K^0$ signal yields, $N_{B^0_s}$ and $N_{B^0_d}$. These are converted into $B^0_s$ and $B^0_d$ meson yields after dividing by the branching fractions of the relevant decays and correcting for the relative efficiency $R_{\text{eff}}$ that is expressed as a product of acceptance and selection efficiency ratios for the two modes and is determined from Monte Carlo (MC) simulations:

$$
\frac{f_s}{f_d} = \frac{N_{B^0_s}}{N_{B^0_d}} \frac{B(B^0_s \rightarrow J/\psi K^0) B(K^0 \rightarrow K^- \pi^+)}{B(B^0_d \rightarrow J/\psi \phi) B(\phi \rightarrow K^- K^0) R_{\text{eff}}},
$$

where the $J/\psi$, $\phi$, and $K^0$ are reconstructed in their $J/\psi \rightarrow \mu^+\mu^-$, $\phi \rightarrow K^+ K^-$, and $K^0 \rightarrow K^+ \pi^-$ final states [10], respectively. The data sample consists of $pp$ collisions collected with the ATLAS detector at $\sqrt{s} = 7$ TeV corresponding to an integrated luminosity of 2.47 $\pm$ 0.04 fb$^{-1}$. The ATLAS multipurpose detector is described in detail in Ref. [11].

The PYTHIA 6 and 8 [12,13] MC generators with parameters tuned to reproduce ATLAS data [14] are used to simulate background and signal events, respectively. For the signal channels, the angular distributions are produced with the measured polarization parameters [15]. The detector response for the generated events is simulated with GEANT4 [16,17].

The $B^0_s \rightarrow J/\psi \phi$ and $B^0_d \rightarrow J/\psi K^0$ signal candidates consist of two muons and two hadrons originating from a common secondary vertex. The $J/\psi$ candidates are selected from the dimuon trigger sample requiring two oppositely charged muon candidates, each having a transverse momentum of $p_T > 4$ GeV. Reconstructed muon candidates are categorized either as combined or segment-tagged muons. A combined muon consists of an inner detector (ID) track combined with a muon spectrometer (MS) track using tight matching criteria, while a segment-tagged muon requires an ID track and track segments in the MS that are not reconstructed as an MS track [11]. The two muons, of which at least one must be a combined muon, are fitted to originate from the same two-track vertex.
vertex fit chi-square per degree of freedom (dof) is required to be $\chi^2$/dof < 10. To improve the sample purity, each muon track must have at least one hit in the pixel detector, more than five hits in the silicon strip detector and at least one hit in the transition radiation tracker that reduces the pseudorapidity coverage to $|\eta| < 2.0$ [18].

Since the dimuon mass resolution is different for muons reconstructed in the end caps ($1.05 < |\eta| < 2.5$) and for muons reconstructed in the barrel ($|\eta| < 1.05$), all accepted $J/\psi$ candidates are divided into three classes: two barrel muons (BB), one end-cap and one barrel muon (EB), and two end-cap muons (EE). The parameters describing the dimuon mass distribution in the $J/\psi$ signal region for the three pseudorapidity classes in data and in $B^0\rightarrow J/\psi K^{\ast0}$ MC signal samples are extracted from maximum-likelihood fits. Signal events are selected requiring mass windows of $\pm 3\sigma$ around the $J/\psi$ peak in data and simulations. For data, the selected signal regions are 2.991–3.197 GeV for BB, 2.955–3.235 GeV for EB, and 2.914–3.275 GeV for EE classes, while in simulations they are slightly smaller.

The $B^0\rightarrow J/\psi K^{\ast0}$ candidates are reconstructed from a $J/\psi$ candidate plus two oppositely charged hadrons with a kaon mass hypothesis assigned. The dimuon mass is constrained to the $J/\psi$ mass [15], and the $J/\psi$ and two kaons have to originate from the same vertex. All combinations are accepted if $p_T(B^0) > 8$ GeV, $\chi^2$/dof < 3 for the vertex fit and the $K^+ K^-$ invariant mass lies in the range determined by $\pm 2$ natural widths ($\Gamma_{\phi}$) around the $\phi$ mass peak, 1011 $< m_{K^+ K^-} < 1028$ MeV. The $m_{K^+ K^-}$ distribution is modeled with a Breit-Wigner line shape convolved with a Crystal Ball function [19]. The selected mass window retains 85% of signal events.

The $B^0_d$ candidates are reconstructed in a similar way. Here, one track of the $K^{\ast0}$ decay is assigned a kaon mass hypothesis and the other track a pion mass hypothesis. Since ATLAS has limited kaon-pion separation capability in the momentum range relevant for this analysis, both $K\pi$ mass assignment combinations are tested. That with mass closest to the nominal $K^{\ast0}$ mass is chosen, yielding the correct $K\pi$ selection for 86% of all $K^{\ast0}$ candidates. The probability density function (PDF) for the invariant mass of correctly selected $K\pi$ candidates is modeled with a relativistic Breit-Wigner line shape convolved with a Crystal Ball function, while that where the $K$ and $\pi$ are swapped is modeled with a Gaussian function. The decay $B^0_d \rightarrow J/\psi K^{\ast0}$ produces a peaking background in $B^0\rightarrow J/\psi K^{\ast0}$ that appears in the low $K^{\ast0}$ mass region. To remove this contribution, the selected $K^{\ast0}$ region is constrained to one $K^{\ast0}$ decay width around the $K^{\ast0}$ mass peak, corresponding to $847 < m_{K\pi} < 942$ MeV for data. Since the $K^{\ast}$ line shape is narrower in the MC simulations than in data, the $K\pi$ mass selection needs to be adjusted in simulations to produce identical efficiencies in data and simulations. For the $K^+ K^-$ mass selection, a similar procedure is used.

The signal-to-background ratios for $B^0_d \rightarrow J/\psi K^{\ast0}$ and $B^0_d \rightarrow J/\psi K^{\ast0}$ decays are optimized using three variables with high background suppression power: the $\chi^2$/dof of the $B$ vertex fit, the transverse decay length $L_{xy}$ defined as the length of the vector from the primary vertex (PV) [20] to the $B$ decay vertex in the transverse plane, and the pointing angle $\alpha$ defined as the angle between the $B$ meson transverse momentum and $L_{xy}$. If more than one $PV$ candidate exists, the one is selected for which the sum of squared transverse momenta of all tracks originating from the vertex, $\sum p_T^2$, yields the highest value. The $\chi^2$/dof, $L_{xy}$ and $\alpha$ selection criteria are optimized using simulated $B^0_d \rightarrow J/\psi K^{\ast0}$ and $B^0\rightarrow J/\psi K^{\ast0}$ events for signal and data sidebands for background.

To produce similar $p_T$ and $\eta$ distributions in data and MC, data-driven weights are obtained by the following procedure. Sideband-subtracted $B^0\rightarrow J/\psi K^{\ast0}$ ($B^0_d \rightarrow J/\psi K^{\ast0}$) $p_T$ and $\eta$ distributions from data are compared with corresponding distributions in simulation in the signal region, $5.32 < m_{J/\psi K^{\ast0}} < 5.42$ ($5.21 < m_{J/\psi K^{\ast0}} < 5.35$) GeV. The upper and lower sidebands $5.20 < m_{J/\psi K^{\ast0}} < 5.25$ ($5.09 < m_{J/\psi K^{\ast0}} < 5.16$) GeV and $5.48 < m_{J/\psi K^{\ast0}} < 5.53$ ($5.40 < m_{J/\psi K^{\ast0}} < 5.47$) GeV are selected such that their summed yields represent the expected backgrounds in the signal region for the data. The weights are obtained by dividing the yield in each $p_T$ and $\eta$ bin in data by the corresponding yield of the MC sample using only events with odd event numbers. Thus, for each bin $(i)$ and $(j)$ of the $p_T$ and $\eta$ distributions, a weight is determined as a product of a $p_T$–dependent and $\eta$–dependent weights:

$$W_{ij}(p_T, \eta) = \frac{n_i^{\text{data}/\text{MC}}(p_T) n_j^{\text{data}}(\eta)}{n_i^{\text{MC}}(p_T) n_j^{\text{MC}/\text{MC}}(\eta)},$$

where $n_i^{\text{data}/\text{MC}}(p_T)$ is the normalized number of entries in the $p_T$ bin $i$ and $n_j^{\text{data}/\text{MC}}(\eta)$ is that in the $\eta$ bin $j$. To obtain good agreement between data and simulation, the procedure is repeated twice. The two sets of weights are multiplied and are used to correct the $p_T$ and $\eta$ distributions of the MC sample with even event numbers. From the corrected MC samples, distributions for $\chi^2$/dof, $L_{xy}$, and $\alpha$ are determined, which are in good agreement with those measured in the data. The correlation between $p_T$ and $\eta$ is small and is accounted for in the systematic error.

For both modes, the dominant background originates from a $J/\psi$ produced at the PV plus two oppositely charged hadrons (direct $J/\psi$) [21]. Since the hadrons are not associated with any $B^0(B^0_d)$ decay, the $J/\psi K^+ K^-(J/\psi K^+ \pi^-)$ invariant-mass spectrum does not peak but decreases with mass. Another large background consists of two random low-momentum, oppositely
charged muons combined with two random charged hadrons. Here, the dimuon mass distribution does not peak at the $J/\psi$ nor does the four-particle mass show any peaking structure. Inclusive decays $B \to J/\psi X$, where $X$ is a single hadron or a collection of hadrons, provide a source of background that is very similar to the signal. If $X$ consists of exactly two charged-particle tracks (without any $\pi^0$), the mode is topologically indistinguishable from the signal mode. Self-cross-feed, in which one or both hadrons from the $\phi(K^{0})$ decay are replaced with random hadrons, is negligible. In addition, peaking backgrounds from $B^0_d \to J/\psi K^{+} \pi^-$ and $B^0_s \to J/\psi K^{+} \pi^-$ contribute to $B^0 \to J/\psi \phi$ while $B^0_d \to J/\psi K^{+} \pi^-$ also contributes to $B^0_s \to J/\psi K^{+} \pi^-$. To reduce these backgrounds, the $\chi^2$/dof, $L_{xy}$ and $\alpha$ selections are optimized for each mode separately by determining the maximum value of $S/\sqrt{S+B}$ as a function of selected values for the observable to be optimized, where $S$ represents the signal yield obtained from simulation and $B$ is the background extracted from data sidebands. For the $B^0_s$ ($B^0_d$) mode, the optimization yields $\chi^2$/dof < 2.4 (2.6), $L_{xy} > 0.26$ (0.30) mm, and $\alpha < 0.14$ (0.12) rad. In combination with the $J/\psi$ mass requirement, the $\chi^2$/dof selection reduces the combinatorial background significantly, while the $L_{xy}$ and $\alpha$ selections remove most of the direct $J/\psi$ background.

In the final sample, the signal yields $N_{B^0_d}$ and $N_{B^0_s}$ are extracted from unbinned extended maximum-likelihood fits to the $J/\psi K^+ K^-$ and $J/\psi K^+ \pi^-$ invariant-mass spectra, respectively. The $B^0$ signal PDF is modeled with three Gaussian functions with common mean that is determined from the fit, while widths and fractions are fixed to the values obtained from MC simulations. To account for possible width differences in the two narrowest Gaussian functions between data and simulation, an additional scale factor is introduced, which is left free in the fit. The peaking background PDF is modeled with a Crystal Ball function with parameters fixed to the values obtained in simulations.

The peaking background yield of $652 \pm 93$ events is calculated from the $B^0_d$ signal yield. The selection efficiencies of both peaking background modes are determined from simulation and are fixed in the fit to data. The remaining residual backgrounds are modeled with an exponential function leaving fraction and exponent free in the fit to data.

The $B^0_d$ signal PDF is parametrized with three Gaussian functions that describe both the correctly reconstructed and swapped $K^+ \pi^-$ events. The PDF of the peaking background is modeled with a sum of Crystal Ball and Gaussian functions for which the relative $B^0_d \to J/\psi K^+ \pi^-$ yield with respect to that of the $B^0_s \to J/\psi K^{+} \pi^-$ signal is determined from the corresponding branching fractions and selection efficiencies, yielding $(4.7 \pm 2.4)\%$. Most of the residual background is modeled with an exponential function, while partially reconstructed $B \to J/\psi X$ decays require parametrization with a complementary error function. All parameters of the residual background PDFs are left free in the fit.

Figure 1 shows the measured $J/\psi \phi$ and $J/\psi K^{+} \pi^-$ invariant-mass spectra with fits overlaid. The fits yield $N_{B^0_d} = 6640 \pm 100$ and $N_{B^0_s} = 36290 \pm 320$. The $B^0_d \to J/\psi K^{+} \pi^-$ signal events. The $\chi^2$/dof values of the fits are 0.959 for $B^0_d$ and 0.945 for $B^0_s$, indicating that both fits describe the data well.

The additive systematic uncertainties result from the $B^0_s \to J/\psi \phi$ and $B^0_d \to J/\psi K^{+} \pi^-$ signal and background parametrizations. The contribution from the signal shape parametrization is calculated by varying the five fixed parameters within $\pm 1\sigma$ in a multivariate Gaussian function that takes into account all correlations. For nonpeaking backgrounds, the exponential function is replaced with a second-order polynomial for the $B^0_s$ and with a second-order polynomial plus an error function for the $B^0_d$. The difference in signal yield with respect to the nominal fit is taken as a systematic error. For peaking backgrounds, the

fixed parameters are varied by $\pm 1\sigma$, and the difference with respect to the nominal yield is taken as a systematic error. In addition, since S-wave contributions from $B^0_s \to J/\psi K^{*0}$ and $B^0_d \to J/\psi f_0(980)$ decays to $B^0_s \to J/\psi \phi$ and $B^0_d \to J/\psi K^{*0}$ are neglected in the fits, an uncertainty is derived using the ATLAS measured contribution of 2.4% [22] for $B^0_s \to J/\psi \phi$, and the contribution of 1% for $B^0_s \to J/\psi K^{*0}$ derived from the MC simulation. All additive systematic errors are added in quadrature, yielding total additive uncertainties of 220 $N_{B^0_s}$ and 650 $N_{B^0_d}$ events.

The multiplicative systematic uncertainty includes contributions from the relative efficiency and the branching fractions of the $\phi$ and $K^{*0}$ decays. The uncertainty on the relative efficiency is dominated by the uncertainty on the $\phi/K^{*0}$ selection (1.2%), which is obtained by varying the fixed fit parameters in the $\phi$ and $K^{*0}$ fits by $\pm 1\sigma$ and adding all contributions in quadrature. Other uncertainties from the $J/\psi$ selection (0.2%), reweighting (0.4%), $B^0_s$ and $B^0_d$ lifetimes (0.002%), and the contribution due to uncertainties in the polarization parameters (0.01%) are negligible. Varying the selection criteria of $\chi^2$/dof, $L_{\text{xy}}$, and $\alpha$ gives negligible contributions. Table I summarizes the contributions of the additive and multiplicative systematic errors.

From the ratio $N_{B^0_s}/N_{B^0_d}$ after efficiency correction and division by $\phi$ and $K^{*0}$ decay branching fractions, ATLAS measures

$$f_s B(B^0_s \to J/\psi \phi)/f_d B(B^0_d \to J/\psi K^{*0}) = 0.199 \pm 0.004(\text{stat}) \pm 0.008(\text{syst}).$$

A perturbative QCD prediction [23] yields

$$B(B^0_s \to J/\psi \phi)/B(B^0_d \to J/\psi K^{*0}) = 0.83^{+0.03}_{-0.02}(\omega_B)^{+0.01}_{-0.00}(f_M)^{+0.01}_{-0.02}(a_1)^{+0.01}_{-0.02}(m_c),$$

where the uncertainties result from the shape parameter $\omega_B$ of the $B$ meson wave function, meson decay constants $f_M$, Gegenbauer moments $a_1$, and the $c$-quark mass. Adding all contributions linearly yields a 7.1% theory error. Using this prediction, the ratio of fragmentation fractions is measured to be

$$f_s/f_d = 0.240 \pm 0.004(\text{stat}) \pm 0.010(\text{syst}) \pm 0.017(\text{th}).$$

Figure 2 (right panel) shows the ATLAS $f_s/f_d$ measurement in comparison with results from LEP [6], CDF [6,7], and LHCb [8,9]. The ratio $f_s/f_d$ may depend on $p_T$ and $\eta$ of the $B$ meson; e.g., LHCb observes a $p_T$ but no $\eta$ dependence of $f_s/f_d$ [8]. Figure 2 (left panel) shows the $p_T$ dependence of $f_s/f_d$ for ATLAS and that of other...
experiments. To investigate the $p_T$ and $\eta$ dependence of $f_s/f_d$, the data sample is divided into six $p_T$ bins in the range $8 \text{ GeV} < p_T < 50 \text{ GeV}$ and into four $\eta$ bins for $|\eta| < 2.5$ such that the number of events in each bin is approximately equal. The $f_s/f_d$ distributions as a function of $p_T$ and $\eta$ have been fitted with a uniform (first-order polynomial) distribution yielding fit $p$ values $0.54$ (0.66) and $0.66$ (0.49), respectively. No significant $f_s/f_d$ dependence on $p_T$ and $|\eta|$ is seen at the present level of accuracy.

In summary, this Letter reports on the first ATLAS measurement of the ratio of $B^0 \to J/\psi \phi$ and $B_d^0 \to J/\psi K^{*0}$ branching fractions multiplied by the ratio of fragmentation fractions $f_s/f_d$ from which $f_s/f_d$ is determined. The data were produced at the LHC in pp collisions at $\sqrt{s} = 7 \text{ TeV}$ and correspond to an integrated luminosity of $2.47 \text{ fb}^{-1}$. This $f_s/f_d$ measurement, obtained with a new approach, agrees with the LHCb [8,9] results, improving the world average considerably. A comparison with the CDF [6,7] measurement and the LEP [6] average confirms the universality of $f_s/f_d$. The ATLAS data show no dependence on $p_T$ nor on $|\eta|$ within the kinematic range tested.

We thank CERN for the very successful operation of the LHC, as well as the support staff from our institutions without whom ATLAS could not be operated efficiently. 52 II Physikalisches Institut, Justus-Liebig-Universität Giessen, Giessen, Germany
53 SUPA - School of Physics and Astronomy, University of Glasgow, Glasgow, United Kingdom
54 II Physikalisches Institut, Georg-August-Universität, Göttingen, Germany
55 Laboratoire de Physique Subatomique et de Cosmologie, Université Grenoble-Alpes, CNRS/IN2P3, Grenoble, France
56 Department of Physics, Hampton University, Hampton, Virginia, USA
57 Laboratory for Particle Physics and Cosmology, Harvard University, Cambridge, Massachusetts, USA
58a Kirchhoff-Institut für Physik, Ruprecht-Karls-Universität Heidelberg, Heidelberg, Germany
58b Physikalisches Institut, Ruprecht-Karls-Universität Heidelberg, Heidelberg, Germany
58c ZITI Institut für technische Informatik, Ruprecht-Karls-Universität Heidelberg, Mannheim, Germany
59 Faculty of Applied Information Science, Hiroshima Institute of Technology, Hiroshima, Japan
60a Department of Physics, The Chinese University of Hong Kong, Shatin, N.T., Hong Kong, China
60b Department of Physics, The University of Hong Kong, Hong Kong, China
60c Department of Physics, The Hong Kong University of Science and Technology, Clear Water Bay, Kowloon, Hong Kong, China
61 Department of Physics, Indiana University, Bloomington, Indiana, USA
62 Institut für Astro- und Teilchenphysik, Leopold-Franzens-Universität, Innsbruck, Austria
63 University of Iowa, Iowa City, Iowa, USA
64 Department of Physics and Astronomy, Iowa State University, Ames, Iowa, USA
65 Joint Institute for Nuclear Research, JINR Dubna, Dubna, Russia
66 KEK, High Energy Accelerator Research Organization, Tsukuba, Japan
67 Graduate School of Science, Kobe University, Kobe, Japan
68 Faculty of Science, Kyoto University, Kyoto, Japan
69 Kyoto University of Education, Kyoto, Japan
70 Department of Physics, Kyushu University, Fukuoka, Japan
71 Instituto de Física La Plata, Universidad Nacional de La Plata and CONICET, La Plata, Argentina
72 Physics Department, Lancaster University, Lancaster, United Kingdom
73a INFN Sezione di Lecce, Lecce, Italy
73b Dipartimento di Matematica e Fisica, Università del Salento, Lecce, Italy
73c Oliver Lodge Laboratory, University of Liverpool, Liverpool, United Kingdom
74 Department of Physics, Jožef Stefan Institute and University of Ljubljana, Ljubljana, Slovenia
75 School of Physics and Astronomy, Queen Mary University of London, London, United Kingdom
76 Department of Physics, Royal Holloway University of London, Surrey, United Kingdom
77 Department of Physics and Astronomy, University College London, London, United Kingdom
78 Louisiana Tech University, Ruston LA, United States of America
79 Laboratoire de Physique Nucléaire et de Hautes Energies, UPMC and Université Paris-Diderot and CNRS/IN2P3, Paris, France
80 Ångströmsläktet, Lunds universitet, Lund, Sweden
81 Departamento de Física Teorica C-15, Universidad Autonoma de Madrid, Madrid, Spain
82 Institut f"ur Physik, Universit"at Mainz, Mainz, Germany
83 School of Physics and Astronomy, University of Manchester, Manchester, United Kingdom
84 CPPM, Aix-Marseille Université and CNRS/IN2P3, Marseille, France
85 Department of Physics, University of Massachusetts, Amherst, Massachusetts, USA
86 Department of Physics, McGill University, Montreal, Québec, Canada
87 School of Physics, University of Melbourne, Victoria, Australia
88 Department of Physics, The University of Michigan, Ann Arbor, Michigan, USA
89 Department of Physics and Astronomy, Michigan State University, East Lansing, Michigan, USA
90 INFN Sezione di Milano, Milano, Italy
Faculté des Sciences, Université Mohamed Premier and LPTPM, Oujda, Morocco

Faculté des sciences, Université Mohammed V-Agdal, Rabat, Morocco

DSM/IRFU (Institut de Recherches sur les Lois Fondamentales de l’Univers), CEA Saclay (Commissariat à l’Énergie Atomique et aux Énergies Alternatives), Gif-sur-Yvette, France

Santa Cruz Institute for Particle Physics, University of California Santa Cruz, Santa Cruz, California, USA

Department of Physics, University of Washington, Seattle, Washington, USA

Department of Physics and Astronomy, University of Sheffield, Sheffield, United Kingdom

Department of Physics, Shinshu University, Nagano, Japan

Fachbereich Physik, Universität Siegen, Siegen, Germany

Department of Physics, Simon Fraser University, Burnaby, British Columbia, Canada

Faculty of Mathematics, Physics & Informatics, Comenius University, Bratislava, Slovak Republic

Department of Subnuclear Physics, Institute of Experimental Physics of the Slovak Academy of Sciences, Kosice, Slovak Republic

Department of Physics, University of Cape Town, Cape Town, South Africa

Department of Physics, University of Johannesburg, Johannesburg, South Africa

School of Physics, University of the Witwatersrand, Johannesburg, South Africa

Department of Physics, Stockholm University, Stockholm, Sweden

Department of Physics, Technion: Israel Institute of Technology, Haifa, Israel

Department of Physics, Aristotle University of Thessaloniki, Thessaloniki, Greece

Physics Department, Royal Institute of Technology, Stockholm, Sweden

Departments of Physics & Astronomy and Chemistry, Stony Brook University, Stony Brook, New York, USA

Department of Physics and Astronomy, University of Sussex, Brighton, United Kingdom

School of Physics, University of Sydney, Sydney, Australia

Institute of Physics, Academia Sinica, Taipei, Taiwan

Raymond and Beverly Sackler School of Physics and Astronomy, Tel Aviv University, Tel Aviv, Israel

Department of Physics, Aristotle University of Thessaloniki, Thessaloniki, Greece

International Center for Elementary Particle Physics and Department of Physics, The University of Tokyo, Tokyo, Japan

Graduate School of Science and Technology, Tokyo Metropolitan University, Tokyo, Japan

Department of Physics, Tokyo Institute of Technology, Tokyo, Japan

Department of Physics, University of Toronto, Toronto ON, Canada

TRIUMF, Vancouver BC, Canada

Department of Physics and Astronomy, York University, Toronto, Ontario, Canada

Faculty of Pure and Applied Sciences, University of Tsukuba, Tsukuba, Japan

Department of Physics and Astronomy, Tufts University, Medford, Massachusetts, USA

Centro de Investigaciones, Universidad Antonio Narino, Bogota, Colombia

Department of Physics and Astronomy, University of California Irvine, Irvine, California, USA

INFN Gruppo Collegato di Udine, Sezione di Trieste, Udine, Italy

ICTP, Trieste, Italy

Dipartimento di Chimica, Fisica e Ambiente, Università di Udine, Udine, Italy

Department of Physics, University of Illinois, Urbana, Illinois, USA

Department of Physics and Astronomy, University of Uppsala, Uppsala, Sweden

Instituto de Física Corpuscular (IFIC) and Departamento de Física Atómica, Molecular y Nuclear and Departamento de Ingeniería Electrónica and Instituto de Microelec trónica de Barcelona (IMB-CNM), University of Valencia and CSIC, Valencia, Spain

Department of Physics, University of British Columbia, Vancouver, British Columbia, Canada

Department of Physics and Astronomy, University of Victoria, Victoria, British Columbia, Canada

Department of Physics, University of Warwick, Coventry, United Kingdom

Waseda University, Tokyo, Japan

Department of Particle Physics, The Weizmann Institute of Science, Rehovot, Israel

Department of Physics, University of Wisconsin, Madison, Wisconsin, USA

Fakultät für Physik und Astronomie, Julius-Maximilians-Universität, Würzburg, Germany

Department of Physics, Yale University, New Haven, Connecticut, USA

Yerevan Physics Institute, Yerevan, Armenia

Centre de Calcul de l’Institut National de Physique Nucléaire et de Physique des Particules (IN2P3), Villeurbanne, France

Deceased.

Also at Department of Physics, King’s College London, London, United Kingdom.

Also at Institute of Physics, Azerbaijan Academy of Sciences, Baku, Azerbaijan.

Also at Novosibirsk State University, Novosibirsk, Russia.

Also at TRIUMF, Vancouver BC, Canada.
