With the incessant growth of the ‘data-driven economy’ have come calls for the introduction of a novel property right in data. Apparently in response to demands from the automotive industry, and encouraged by a number of German lawyers and scholars, the European Commission has in its 2017 Communication on ‘Building a European data economy’ tentatively advanced the idea of creating at EU level a ‘data producer’s right’ that would protect industrial data against the world. The movement for ‘data property’ (in German Dateneigentum) has its champion in European Commissioner Günther Oettinger, who until 2016 led the directorate general that is responsible for the Communication, DG Connect. An op-ed published by Mr. Oettinger in the Frankfurter Allgemeine Zeitung reveals some of the thinking and the powerful forces behind this revolutionary legal concept. Data, writes Oettinger, are the “gold of the future”, principally in the automotive sector where modern sensor-equipped cars automatically generate and collect large amounts of data – on traffic and road conditions, engine performance, etc. These machine-generated sensor data have enormous value, for example, for developing self-driving automobiles. But – writes Oettinger – it is as yet unclear who owns these data: the automobile manufacturer; the car owner; the producer of the sensor equipment; or no one at all? What we need, concludes the Commissioner, are rules at EU level that establish data ownership.

Apparently inspiring this call for protecting industrial data is the fear – common to other recent policy initiatives – that valuable European assets are being misappropriated by large American companies. The specter of Google ‘stealing’ European news has already led to an ongoing EU initiative towards a neighbouring right for news publishers, following comparable rules previously introduced in Germany and Spain. The sui generis database producer’s right introduced in Europe in 1996 was similarly inspired by European fears of dominance by the US database industry.

Although the contours of the ‘data producer’s right’ being contemplated by the European Commission are sketchy, as are its economic underpinnings, such a right would most likely bring the protection of industrial data in the EU to a much higher level than the – much-maligned and still apparently unnecessary – German database producer’s right introduced in 2014.

Notwithstanding this uncertainty, the calls for a ‘data producer’s right’ in Europe have much to do with the idea of creating at EU level a ‘data producer’s right’ that would protect industrial data against the world. The movement for ‘data property’ (in German Dateneigentum) has its champion in European Commissioner Günther Oettinger, who until 2016 led the directorate general that is responsible for the Communication, DG Connect. An op-ed published by Mr. Oettinger in the Frankfurter Allgemeine Zeitung reveals some of the thinking and the powerful forces behind this revolutionary legal concept. Data, writes Oettinger, are the “gold of the future”, principally in the automotive sector where modern sensor-equipped cars automatically generate and collect large amounts of data – on traffic and road conditions, engine performance, etc. These machine-generated sensor data have enormous value, for example, for developing self-driving automobiles. But – writes Oettinger – it is as yet unclear who owns these data: the automobile manufacturer; the car owner; the producer of the sensor equipment; or no one at all? What we need, concludes the Commissioner, are rules at EU level that establish data ownership.

Apparently inspiring this call for protecting industrial data is the fear – common to other recent policy initiatives – that valuable European assets are being misappropriated by large American companies. The specter of Google ‘stealing’ European news has already led to an ongoing EU initiative towards a neighbouring right for news publishers, following comparable rules previously introduced in Germany and Spain. The sui generis database producer’s right introduced in Europe in 1996 was similarly inspired by European fears of dominance by the US database industry.

Although the contours of the ‘data producer’s right’ being contemplated by the European Commission are sketchy, as are its economic underpinnings, such a right would most likely bring the protection of industrial data in the EU to a much higher level than the – much-maligned and still apparently unnecessary – German database producer’s right introduced in 2014.
The arguments advanced by proponents of introducing a right of ‘data property’ can be roughly summarized as follows. First, it is alleged that the sector is unique in a number of respects: Specifically, the value of data in this sector is highly uncertain and hard to predict. This makes it difficult for producers to plan and invest. Furthermore, data are often highly perishable and of low cost of production, making it difficult for producers to recover their costs. They may therefore be reluctant to invest in the production of data, knowing that they may not be able to recoup these costs. Therefore, data property allows producers to be rewarded for the production of data, encouraging them to invest in this area.

Secondly, the argument is made that data property would provide a legal framework for the sharing and reuse of data. Without such a framework, data are often held back from being shared and reused due to concerns about ownership and liability. A data property right would provide a legal basis for the sharing and reuse of data, encouraging more innovation and collaboration in the sector.

Finally, data property would provide a means of protection for data that are not covered by existing intellectual property rights. For example, data that are machine-generated, or data that are not covered by copyright, may not be adequately protected by existing rights. A data property right would provide a means of protecting these types of data, encouraging producers to invest in the creation of such data.

In conclusion, data property has the potential to provide a legal framework for the effective exploitation of data. It would encourage investment in the production of data, provide a basis for the sharing and reuse of data, and protect data that are not covered by existing intellectual property rights. However, it is also clear that there are a number of challenges and concerns that need to be addressed in order to implement a data property right effectively.
ments for the introduction of such a new IPR.24 A more recent, and more elaborate study by the Joint Research Centre of the European Commission is somewhat less skeptical,25 recognizing that legal uncertainty regarding data ownership rights might negatively affect the efficiency of data markets. However, this study also concludes that there are, at present, no compelling economic arguments to advise regulatory intervention.

This article will, however, not further engage in economic analysis of a possible data property right, but focus instead on its consequences for the existing system of intellectual property. In order to so, it is important to gain some preliminary understanding of what such a right might entail. Drawing from the sketch presented in the Staff Working Paper that underlies the European Commission’s recent Communication,26 which seems to be largely based on the work of Prof. Herbert Zech,27 we assume that features of a data producer’s right to be roughly as follows. The right would create a right in rem (i.e. a property right enforceable against the world) in respect of “non-personal or anonymised machine-generated data”. It would encompass “the exclusive right to utilise certain data, including the right to licenc[e] its use”. This would include a set of rights enforceable against any party independent of contractual relations thus preventing further use of data by third parties who have no right to use the data, including the right to claim damages for use or use of a derivative. Whereas the Commission remains vague on the issue of initial ownership, according to Prof. Zech, the right would initially vest in “the economically responsible operator of equipment that generates the data (data producer)”.28 As the European Commission concedes, thus allocating the right might be highly problematic in practice, since data-generating machines are often owned and operated – and corresponding investments done – by numerous different actors.29

In view of its stated aims, the right would have to be fully transferable.30 As to the term of protection, the Commission is silent, but according to Prof. Zech “[a] short term of protection would probably qualify as a right of intellectual property. In sum, both in terms of its intended subject matter (data, an immaterial good) and its scope of protection, the latter is a fundamental right in itself under which natural persons should have control of their own personal data”.31 Otherwise, the Commission’s proposal seems to encompass all sorts of machine-generated data.

As to its precise subject matter, Prof. Zech proposes: “A well-defined subject matter would be machine-readable coded information that is defined only by its representative characters (bits) irrespective of its content (data delimited on the syntactic level).”32 This distinction is reflected in its intended scope. “The scope of protection would in particular include use by carrying out computer statistical analyses, but not the re-creation of the same data by independent measurement.”33 The Commission seems to embrace this distinction, perhaps in the hope that such a limitation might prevent undue information monopolies.34 We shall examine the distinction between syntactic and semantic data in the following section.

In sum, both in terms of its intended subject matter (data, an immaterial good) and its scope of protection (reproduction and use of data by third parties), the proposed producer data’s right would probably qualify as a right of intellectual property.

3. Data in the system of intellectual property

Before further scrutinizing the proposed data right and its possible impact on the system of intellectual property law, we first need to examine how existing legal regimes in the EU deal with machine-generated data. This section will focus on relevant laws of intellectual property, and not discuss other possibly relevant legal mechanisms, such as tangible property, contract and trade secrets. While the focus of this section will be on the two IP regimes most closely associated with protecting data structures, copyright law and sui generis database right, we shall also make a brief excursion into the field of neighboring rights.

3.1 Copyright in data

Is there copyright in data? The textbook answer is a resounding no. As U.S. Supreme Court Justice Warren Brandeis famously stated in his dissent in the INS case, “[t]he general rule of law is, that the noblest of human productions - knowledge, truths ascertained, conceptions and ideas - after voluntary communication to others, are free as the air to common use.”35 Although this also expresses the idea of the ‘idea/expression dichotomy’, the dividing line between an European copyright scholars prefer to say, protected form and unprotected content(s). The rule is generally codified in the U.S. Copyright Act (§ 102 (b)), as well as in the TRIPS Agreement (art. 9(2)) and the WIPO Copyright Treaty (art. 2). In EU law we find a similar rule, albeit limited to computer software, in the Computer Programs Directive (art. 1(2)). Although these provisions do not expressly mention ‘data’, it is generally assumed, and uncontroversial – either on the basis of the ‘dichotomy’ or by way of direct application of copyright’s requirement of authorship and creativity – that there cannot be copyright in data per se.36

Whereas data as such are thus excluded from copyright protection, copyright’s treatment of data compilations is more complex. The Berne Convention protects “collections of literary or artistic works such as encyclopaedias and anthologies” (art. 2(5)), but does not mention collections of mere data, and expressly denies copyright to “news of the day or to miscellaneous facts having the character of mere data”. The TRIPs Agreement (art. 10(2)) more broadly protects “compilations of data or other material, whether in machine readable or other form, which by reason of the selection or arrangement of their contents constitute intellectual creations”. The WIPO Copyright Treaty (art. 5) contains similar language. In line with these modern conventions the EU Database Directive instructs Member States to provide copyright protection to “databases which, by reason of the selection or arrangement of their contents, constitute the author’s own intellectual creation’ (art. 3(1)).

In Football Dataco and others the Court of Justice clarified that the test of ‘the author’s own intellectual creation’ (in short, originality) implies that the selection or arrangement of the data is the result of creative choices. Applying art. 3(1), 2nd sentence (“No other criteria shall be applied to determine their eligibility for that protection”), the Court held that merely investing significant amounts of skill and labour does not justify a finding of originality. In other words, the Directive’s originality standard preempts any (quasi-)copyright protection for databases that are merely the result of investment or other criteria. The Court thus extended not only the United Kingdom’s long-standing practice of according copyright protection to compilations of data based on ‘skill and labour’ (investment), but also similar doctrines in other Member States. For example, the Dutch protection of non-original writings (‘geschriftenbescherming’) that existed for over a century in the Netherlands as a vehicle for protecting non-original writings and compilations, was formally abolished in 2014 following Football Dataco.37

Football Dataco also rules out copyright protection for data compilations that are generated by machines without any human intervention. This is in line with the general rule that copyright requires acts of human authorship. Note however that the U.K. Copyright, Design and Patents Act

41 European Commission, Staff Working Document (n. 4).
43 The Court’s decision has brought to an end not only the United Kingdom’s long-standing practice of according copyright protection to compilations of data based on ‘skill and labour’ (investment), but also similar doctrines in other Member States. For example, the Dutch protection of non-original writings (‘geschriftenbescherming’) that existed for over a century in the Netherlands as a vehicle for protecting non-original writings and compilations, was formally abolished in 2014 following Football Dataco.40
44 Football Dataco also rules out copyright protection for data compilations that are generated by machines without any human intervention. This is in line with the general rule that copyright requires acts of human authorship. Note however that the U.K. Copyright, Design and Patents Act...
appears to extend copyright protection to machine-created works: “in the case of a literary, dramatic, musical or artistic work which is computer-generated, the author shall be taken to be the person by whom the arrangements necessary for the creation of the work are undertaken”.41 Thus investment in ‘creating’ data does not count towards investment. However, the European Court of Justice clarified in British Horseracing (n. 45) that “the purpose of the protection by the sui generis right provided for by the directive is to promote and reward investment in database production, not in generating new data. Where the sui generis right comes close to a property right in aggregate data – and has been justly criticized for its potential of creating harmful information monopolies42 – the Directive’s recitals admonish that the sui generis right “does not in any way constitute an extension of copyright protection to mere facts or data” (recital 45) and “should not give rise to the creation of a new right in the works, data or materials themselves” (recital 46).

Indeed, the database right comes with several statutory limits in order to prevent the right from extending to data in the database per se. The sui generis right protects database producers against ‘extraction’ and ‘reutilization’ of the whole, or a substantial part, of the database (art. 7). In other words, non-substantial takings of data are permitted without authorization. Moreover, as the European Court clarified in British Horseracing,43 sui generis protection does not extend beyond misappropriation of data (contents) that result from substantial investment. In other words, the database right tolerates takings of (potentially valuable) data that are not the product of substantial investment.44

Another delimiting factor is the notion of ‘database’. Art. 1(2) of the Directive defines this as “a collection of independent works, data or other materials arranged in a systematic or methodical way and individually accessible by electronic or other means”. While the Explanatory Memorandum generally describes the contents of the database as “information in the widest sense of that term”,45 the compiled data or materials must be ‘independent’, that is to say, “materials which are separable from one another without their informative, literary, artistic, scientific or other value being affected”.46 Therefore an audiovisual, cinematographic, literary or musical work or a sound recording does not qualify as a database, even if it can be perceived as a representation of data (recital 17). This reflects a clear intention on the part of the European legislature to avoid excessive overlaps between the database right and existing copyright and neighbouring rights.47

Finally, according to art. 1(2) of the Database Directive, the individual elements of the database must be “arranged in a systematic or methodical way”. This squarely rules out protection – whether by copyright or by database right – of ‘collections of raw machine-generated data.

3.3 Phonogram protection

In addition to copyright and database right, the phonographic right – one of the four neighbouring rights recognized at EU level – merits brief consideration. The rights of phonogram producers are harmonized by the Rental Right Directive (currently Directive 2006/115/EC) and the Information Society Directive (Directive 2001/29/EC). These Directives leave defining the notion of ‘phonogram’ to the WIPO Performances and Phonograms Treaty (WPPT) of 1996. According to the WPPT (art. 2) a ‘phonogram’ means ‘the fixation of the sounds of a performance or of other sounds, or of a representation of sounds, other than in the form of a fixation incor

47 British Horseracing (n. 45), para. 31.
50 British Horseracing (n. 45).
53 On the other hand, the European Court has held that the geographical data in topographic map are sufficiently independent from the map itself to qualify as a protected ‘database’. According to the Court, “geographical information extracted from a topographic map by a third party so that that information may be used to produce and market another map retains, following its extraction, sufficient informative value to be classified as ‘independent materials’ of a ‘database within the meaning of that provision.” Freistaat Bayern v Verlag Estebauer GmbH, CJEU 29 October 2015, Case C-490/14.
3.4 Assessment: impact of data property on the system of intellectual property law

As this section shows, both copyright and database rights do not extend to data per se. Both regimes conditionally offer protection to data compilations that result from creative selection and arrangement (copyright) or substantive investment (database right). Both regimes deny protection to raw data. For copyright, this follows from the axiom that only acts of authorship conducted by human beings are protectable. For database right, this is a consequence of the sui generis right’s categorical delimitation: only data structured in a ‘database’ qualify for protection. Moreover, the sui generis right’s substantial investment test sets an – admittedly fairly low – minimum threshold. If operating a machine that records sensor data down to the syntactic layer (e.g. digital weather station or a bicycle computer), then this will not result in a protected database. The CJEU’s ‘Fixtures’ decisions pose an additional hurdle to sui generis protection for machine-generated data by excluding ‘created’ data from protection, thus ruling out machine-generated synthetic data.

In sum, introducing a right in raw, machine-generated industrial data, as envisaged in the Commission’s Communication, would go far beyond the main intellectual property regimes presently existing in Europe in the field of data and information, copyright and database right.

Disruptive overlaps

How would this affect existing intellectual property law? In the first place, creating a new layer of rights in machine-generated data would cause broad and disruptive overlaps with copyright and sui generis right in productions made with the aid of digital machines. For example, a film shot with a digital camera would qualify not only as a work protected by copyright, but also as machine-generated (sensor) data subject to a ‘data producer’s right’. Similarly, the aggregate stock market data in a financial database would be protected both by sui generis right and a ‘data producer’s right’, since the data are recorded automatically by the computerized stock exchange.

Whereas the EU legislature has clearly intended to prevent the database right from spilling over into the realms of copyright and neighbouring rights, the ‘data producer’s right’ would lead to extensive overlaps. As a consequence, the new right might give rise to multiple competing claims of ownership in the same content. To continue with our first example, while the creators of the film (e.g. the director, screen writer, and other creators of the film) could claim authorship in the cinematographic work, the owner or operator of the camera might claim ‘data property’ in the photographic data (i.e. the digital representation of the film), – purely to the unpleasant surprise of the film’s producer. Similar examples might be given with regard to digital photographs or e-books. In the second example, the database producer might be confronted with ‘data property’ claims of the stock exchange, or the exchange’s computational services company.

Another consequence of this wide-ranging overlap would be that statutory limitations and exceptions under copyright, neighbouring rights or database right are ‘trumped’ by data producer’s right. For example, both copyright and database right in the EU presently allow users to copy or extract data from databases for non-commercial research purposes. Unless, the ‘data producer’s right’ would replicate all relevant existing exceptions, it would undermine these essential user freedoms.

This is especially true for data mining. Strangely, while the Commission’s Communication on ‘Building a European data economy’ ponders the introduction of an exclusive right in machine-generated data, one of the highlights of the DSM Directive proposal that is currently being debated in the European Parliament is a mandatory exception, both under copyright and database right, for text and data mining by non-commercial research organisations.

In line with Prof. Zech’s suggestions, the European Commission in its Staff Working Paper attests to substantial overlap of wholesale overlap by distinguishing syntactic from semantic data. The proposed ‘data producer’s right’ would be conceived in such a way that “only the syntactical level of information is protected, not the semantic level!” What is probably meant here is that the raw data would be protected only as regards its digital representation (the machine-readable bits and bytes, the ‘ones and zeros’ in the digital file), not the informational content that these data convey. Thus, the European Commission hopes, the new right would not extend to ideas and information, and the new right would not become a ‘super-IP right’. But would such a distinction really prevent the new right from extensively overlapping with existing IP rights? I do not believe so. The problem here is that digital data are commonly coded and interpreted following standardized rules and protocols. In other words, there usually will be a one-on-one relationship between the (syntactic) data substrate and the (semantic) content layer. Returning to our example of the digitally produced film, any copy of the film’s digital file (the syntactic data) would by necessity also reproduce the copyright protected work (the semantic layer). Thus, the new data right could be invoked against any digital copying (or streaming) of the digitized copyright work. For the same reason, the new right would broadly overlap with database right, even if its scope were confined to the syntactic layer. The phonographic right discussed above illustrates this point. Whereas its subject matter, like the proposed ‘data producer’s right’, is limited to the recorded signal (i.e. syntactic audio data), its scope extends into the semantic realm. Reproducing a cd recording of a musical performance will, by necessity, replicate the underlying musical work and performance.

The only way to prevent the data right from becoming an all-encompassing ‘super-IP right’ would be to categorically exclude all data that (possibly) represent subject matter protected under traditional IP regimes: not just copyright, database right and neighbouring rights, but also design right and perhaps even patents. But even a non-overlapping data right would have seriously corrosive effects on the system of intellectual property, for various reasons. First, it would undermine the economic incentives that underlie IP rights. For example, the main rationale of the database producer’s right is to promote and reward investment in the construction of databases from pre-existing data and other materials. This incentive is clearly undercut if a lower-tier, no-threshold right in machine-generated data were to exist in parallel. Second, and more importantly, it would compromise the general principle of intellectual property - whether utilitarian or grounded in natural law theory - that protection be reserved to creation, innovation or otherwise meritorious investment. A data right in all data produced by machines might, on occasion, protect assets of considerably economic value, but nothing of merit. This has ramifications, in particular, at the political level. With intellectual property laws under increasing fire, legislatures – at EU and national level – need powerful and convincing arguments to defend existing regimes and introduce new rights. In this volatile political climate proposing a data producer’s right with the...

54 Metall auf Metall, Federal Supreme Court, 20 November 2008, case I ZR 12/06, GRUR 2009, 403; German Constitutional Court, 31 May 2016, case 1 BvR 1585/13 of, GRUR 2016, 593 final. Art. 3(1) of the proposed Directive provides: “Member States shall provide for an exception to the rights provided for in Article 2 of Directive 2001/29/EC, Articles 5(a) and 7(1) of Directive 96/9/EC and Article 11(1) of this Directive for reproductions and extractions made by research organisations in order to carry out text and data mining of works or other subject-matter to which they have lawful access for the purposes of scientific research.”

55 Metall auf Metall III, Federal Supreme Court, 1 June 2017, case I ZR 15/16.

56 European Commission, Proposal for a Directive of the European Parliament and of the Council on Copyright in the Digital Single Market, Brussels, 14 September 2016, COM(2016) 593 final. Art. 3(1) of the proposed Directive provides: “Member States shall provide for an exception to the rights provided for in Article 2 of Directive 2001/29/EC, Articles 5(a) and 7(1) of Directive 96/9/EC and Article 11(1) of this Directive for reproductions and extractions made by research organisations in order to carry out text and data mining of works or other subject-matter to which they have lawful access for the purposes of scientific research.”

58 European Commission, Staff Working Document (n. 4).
sole aim of (better) protecting the economic assets of the automotive (or any other) industry will surely backfire. Not only is such an initiative likely to fail in the legislative process, but it will also (re)ignite broader discussions on the legitimacy of intellectual property law.

No legal certainty

Another, more mundane objection against a property right in data lies in its inherent lack of legal certainty. Although it is still not fully conceptualized, it is difficult to imagine a data right sufficiently stable in terms of subject matter, scope and ownership to be admitted to the ranks of intellectual property. As to subject matter, if the right vests in data generated by machine processes, which data would it protect? All the data that the machine produces within a given time frame (e.g. an hour, a minute or a second)? Or all the data that result from a finite machine process (e.g. all the data gathered by a satellite that sensors the earth)?

Admittedly, the sui generis database right has already raised similar questions. With data in a database constantly being updated, what exactly constitutes the protected database? But in database law the definition of ‘database’ and requirement of substantial investment create at least some measure of permanency in the subject matter and scope of the right. This stability is, however, completely absent from the data producer’s right. The problem here is that industrial data generation mostly occurs in real time. The ‘velocity’ – the dynamic nature – of big data makes it impossible to identify an appropriate protection connection. The subject matter of the right is simply too fluid. If this is to become a full-fledged right of intellectual property that is enforceable against the world, it should be possible to ascertain its subject matter – and, by implication, its scope of protection – with sufficient legal certainty.

A related problem is allocating ownership of the right. Since the right would be sparked by machine operations, no causal ownership connection with a natural person as, for instance, in the case of a human author of a written work, would be present. As the EU legislature expressly wishes to preserve as regards ‘text and data mining’ by non-commercial research institutions. The problem with this is that it allows intellectual property rights and is one of the rationales underlying the idea/expression dichotomy. As the literature on the economic potential of ‘big data’ demonstrates, machine-generated data are both input and output to innovative manufacturing processes and value-added services, and thus a major driver of economic growth. This calls for measures promoting access to data and freedom to data mining rather than commodification of data by creating property rights in data. Unless equipped with wide-ranging exceptions and safety valves, introducing a new property right in data might create undesirable data monopolies that could impede, rather than foster, competition.

4. Data property and the free flow of information

The exclusion of data per se from the scope of existing intellectual property regimes is not merely ontological. Although old-school author’s right scholars might argue that data are not copyright works, because data are not ‘created’, this is at best a partial explanation for this exclusion. Rather, IP law’s abhorrence of protecting data reflects implicit or explicit information policies not to protect data. These policies are, in turn, informed by a variety of public interest values and concerns. In the first place, of course, freedom of expression and information – the fundamental freedom enshrined in the European Convention on Human Rights (art. 10 ECHR), and the EU Charter (art. 11).

As case law and doctrine regarding the Convention teach, this fundamental freedom is to be interpreted broadly. Article 10 ECHR is phrased in media-neutral terms and thus applies to old and new media (‘every form of information’ (in Pyrènes c. France), at the very least, the communication of facts, news, knowledge and scientific information. It also, undoubtedly, extends to syntactic data; the scope of article 10 is not limited to (semantic) speech, but extends to the means used for communication purposes. To what extent the article’s protection extends to commercial speech has been a matter of some controversy. However, the European Court of Human Rights has made it clear that information of a commercial nature is indeed protected, albeit to a lesser degree than political speech. Article 10 ECHR prevents states from creating restrictions to the free flow of information unless such restrictions “are prescribed by law and are necessary in a democratic society [...] for the protection of the [...] rights of others”. From this perspective data and information must flow freely, uninhibited by property rights or other state-created restrictions, unless a compelling societal need for protection (“necessary in a democratic society”) can be established. Freedom of expression and information, in other words, makes intellectual property rights in data the exception to the default rule of freedom.

This brings us back to the question of expediency. The EU legislature would bear the burden of proving that a property right in machine-generated data is a socially and economically justified limitation of freedom to conduct a business (‘interference’). The free flow of information is a basic right to freedom of expression and information militates strongly against any new right of intellectual property that would restrict scientists’ access to data - a freedom that the EU legislature expressly wishes to preserve as regards ‘text and data mining’ by non-commercial research institutions. This is why it is difficult to imagine a data right that would be stable enough to be enforced against the world.

65 See Dammann v. Switzerland, ECHR 25 April 2006, no. 77551/01. The Court opines that “the gathering of information was an essential preparatory step in journalism and an inherent, protected part of press freedom”. Surprisingly, data mining for journalistic purposes seems to be overlooked in the proposed TDM exception of the DSM Directive. 66 Max Planck Institute for Innovation and Competition, ‘Data Ownership and Access to Data’, Position Statement of the Max Planck Institute for Innovation and Competition, Max Planck Institute for Innovation & Competition Research Paper No. 16-10 (2016). 2.
Finally, a novel data right would also create new barriers to the freedom of services, one of the four freedoms of the EU Internal Market. In its Communication on ‘Building A European Data Economy’, the European Commission interprets this freedom, together with the freedom of establishment, as implying a “principle of free movement of data within the ELP”. It is hard to see how a novel property right in machine-generated data would square with this freedom.  

5. Conclusion

This article makes the case against introducing a data property right. As we have seen, there are abundant reasons to reject this idea. A ‘data producer’s right’ in machine-generated data would ride roughshod over the existing system of intellectual property. It would violate one of the IP system’s main maxims that data per se are “free as the air for common use”, and that only creative, innovative or other meritory investment is protected. It would corrode IP’s mechanism of incentives by creating an underlayer of rights that automatically protects all data produced with the aid of machines. This parallel layer of rights would, most likely, extensively overlap with other IP regimes, and thus create undue impediments for the exploitation of existing rights, such as copyright and database right, and endanger user freedoms guaranteed under these regimes. It would also give rise to gross legal uncertainty, since the ‘velocity’ of real-time data generation makes it difficult, or even impossible, to circumscribe its subject matter, scope of protection and ownership. More generally, a property right in machine-generated data would contravene freedom of expression and information, and pose new obstacles to freedom of competition, freedom of services and the ‘free flow of data’. 

The great promise of big data – for the economy, for science, for society at large – is that this resource may be freely exploited. Introducing a ‘data right’ preventing unauthorized access to big data would directly contradict this. Indeed, it is hard to understand how the proposed new right would square with the text and data mining proposed by the European legislature in the current EU copyright reform package. 

If, as the European Commission rightly believes, “big data, cloud services and the Internet of Things are central to the EU’s competitiveness”68, one would have expected supporters of a novel data producer’s right to present powerful and convincing arguments in support of this revolutionary proposition. So far, the case for a property right in machine-generated data has yet to be made. As Prof. Drexl and others have pointed out, the existing toolkit of trade secret protection, contract and technological protection measures offers data producers ample means of securing de jure or de facto exclusivity.69 Rather than wasting time and effort on inventing a data producer’s right, the focus of the European Commission’s possible interventions should be on fostering access to big data.70

Fortunately, the possible introduction of a ‘data producer’s right’ is only one of several policy options currently being contemplated by the Commission in its ‘European Data Economy’ initiative. As this article has shown, there are innumerable reasons for the European Commission not to go down this road. If nothing else, Europe’s experience with the sui generis database right should give reason for extreme caution. In 2005, less than ten years after it was introduced at EU level, the European Commission published its first review of the Database Directive, a remarkably self-critical assessment. According to the Commission, “[t]he economic impact of the ‘sui generis’ right on database production is unknown. Unintroduced to stimulate the production of databases in Europe, the new instrument has had no proven impact on the production of databases”.71 The Commission’s report also suggests that the sui generis right has not helped the European industry to overcome its productivity gap vis-à-vis the United States.72 It points to several other deficiencies of the sui generis right, such as its uncertain contours, and its proximity to a property right in data that might negatively affect innovation and growth. The report juxtaposes the legal situation in the EU with that in the United States, where since the Supreme Court’s landmark Feist decision73 no legal protection for ‘sweat of the brow’ based databases exists. Nevertheless, as the Commission wryly observes, “there has been a considerable growth in database production in the US, whereas, in the EU, the introduction of ‘sui generis’ protection appears to have had the opposite effect.”74

The 2005 evaluation report concludes by offering four possible ways forward: (1) repeal the whole Directive; (2) withdraw the sui generis right, (3) amend the sui generis to clarify its scope, and (4) maintain the status quo. Despite these harsh conclusions, the database right has yet to be amended or repealed. The problem is that removing (parts of) a directive is, politically and legislatively, even more complex than substantive harmonization. Repealing the database right would require a new directive not only rescinding major parts of the existing Directive, but also – absurdly – instructing Member States to abolish sui generis database protection. Unsurprisingly, the only option that has so far materialized from the Commission’s assessment is no. 4: “do nothing”.75

The lessons of the EU’s database experiment76 are not to be forgotten. Introducing a novel right of intellectual property should never be done in the spur of the moment. Any new right should be contemplated only after conducting thorough economic, evidence-based research that demonstrates a real need for the right and predicts its consequences for information markets and society at large. Assuming a convincing case in support of the right might indeed be made, this should then be followed by systematic legal analysis of the new right’s contours and scope, and of its impact on the existing system of intellectual property. The two-tiered structure of the Union does not allow for legal experimentation at the EU level. Like the database right, a ‘data producer’s right’ would be here to stay – a most unwelcome guest in the house of European intellectual property.
