Performing the work presented in this thesis was only possible thanks to the contribution of a huge number of people, with special reference to the school children survey in which around 25,000 people were involved, including teachers, parents and children. I am grateful for the human spirit I saw during the past years. Without the great help of so many of you, this work would never have been possible. I always enjoyed working with people. During the last few years I became conscious about how much we can share and gain from each other.

First, I would like to express my gratitude to the study population who agreed to participate in these studies.

I would like to thank my promoter Prof. Dr. William Faber for his assistance and guidance. I would like to express my appreciation to the special support that he gave me during the school children survey in Brazil. I thank my Brazilian co-promoter Dr. Euzenir Nunes Sarno who gave continuously encouragement and assistance. I especially want to thank Dr. Paul Klatser my co-promoter in The Netherlands. I appreciated and enjoyed working with him. It was always nice to know that at any moment I could go to his office with a question. He influenced me very much in my research during these years. I almost panicked when he was appointed as the Head of the Biomedical Research Department of KIT and realized that his time would be much too short for long discussions. In the end it turned out to be a positive change, I am forever indebted to him.

I express my gratitude to Dr. Linda Oskam for having spent so much of her time discussing the work with me. Her support and advice in the last phase of the thesis preparation is much appreciated.

I would like to thank all my colleagues at KIT. It is really special to be able to say that in our department I got help from everyone. From the moment Jannet van Leeuwen joined me in the preparation of the school children survey (SCS) she gave a lot more than just her best. Jannet and also Nel Kroon where relentless in their efforts when assisting in the testing of thousands of samples from the SCS. To both of them I am most thankful.

I also want to express my sincere gratitude to the ones that as volunteers, here in the Netherlands, joined the fight against leprosy and dedicated their time to help a friend. A special thanks to Isabel Vöhringen who dedicated many weeks helping me with the school children survey. Without them, organizing the material would have been much more difficult.

I am grateful to Dr. Henk Eggens for encouraging me to participate in the International Course on Biomedical Research Development (ICBRD). I express my appreciation to all
the people from the Netherlands Leprosy Relief (NLR) in special Helga Dietrich, Daan Posteen and Bert Zielhuis for their support. I would like to thank Erik Slim for all the fruitful discussions we had.

This work would not have been possible without the cooperation and support from Brazil. I am indebted to Dr. Maria Leide Wand-Del-Rey de Oliveira and Dr. Gerson Fernando Mendes Pereira who supported my studies in their role as ‘Coordenador(a) Nacional de Dermatologia Sanitaria’. Their recommendations for collaboration made it possible to perform the studies presented in tree chapters of this thesis. Without their help it would not be possible to build up the necessary relevant networks in Brazil enabling the studies in Brazil. I would like to extend my words of thanks to the dedicated staff of the Brazilian National Leprosy Control Program.

I am thankful to Dra. Maria Aparecida de Faria Grossi, Enfa. Marizete Altoe Puppin, Dra. Heloisa Helena Ramos Fonseca and the staff of the State Leprosy Control Programs in Minas Gerais, Espirito Santo, and Santa Catarina. I also want to express my gratitude to all the workers and coordinators of the Control Programs as well as the Education Department staff involved in the studies. I am much indebted to the medical doctors that participated as project leaders in every state. They performed a great deal of work organizing and executing the field activities in their states. We gained a lot from Dra. Elisabete Santos Madeira’s ability of organizing fieldwork in Espirito Santo. Her knowledge helped us when planning and executing in the other states too. It was encouraging to have Dra. Rita Lecco Fioravanti and the students from the Faculdade de Farmacia e Bioquimica do Espirito Santo performing enthusiastically the fieldwork. I am especially grateful to Dr. Marco Antonio Dutra for caring on alone the last phase of the fieldwork in Minas Gerais. Some special words to Dra. Magali Chaves Luis for her dedication to the study despite of being so busy with her patients and the preparation of her own thesis. I also thank the students from Santa Catarina that participated in the SCS.

I would like to express my gratitude to the support received in the Laboratório de Hanseníase at FIOCRUZ Institute in Rio de Janeiro, a very stimulating research environment. I enjoyed working there and so did all students from The Netherlands that performed studies applying the dipsticks. The collaboration between KIT and FIOCRUZ, which emerged during these years, with Dr. Euzenir Nunes Sarno and her team, has proved to be very fruitful. I am especially thankful for Dr. Elisabeth Pereira Sampaio for her support and friendship. I thank Dr. Haroldo de Mattos and Dr. José Nery for their special dedication in support.

I would like to thank Dr. Ronaldo Derzy Amazonas and Dr. Aluysio de Albuquerque Silva Júnior, the Board Directors of Instituto Alfredo da Matta for their permission and support to perform two studies of this thesis in their Institute. I would like to extent my words of thank to the enthusiastic staff, without their help it would not be possible to have
Acknowledgements

such productive stay in Manaus. Especially, I wish to express my gratitude to Dra. Maria da Graça, her generosity and friendship made my stay special. The support of the team of medical doctors from the Institute was very much appreciated. I want to thank the Sisters Ângela, Lucia, Aldenise, Natividad, Martina, Montserreat, Guilhermina, and the lovely Irmã Teresa. They were a wonderful family for me during my stay in Manaus, their dedicated work is extremely inspiring.

I want to express my sincere gratitude to Dr. Pamela Wright. When I first met Pamela she was the ICBRD course coordinator. I had no idea how much my life would change after that day. Her ability of identifying and solving problems combined to her capacity of creating a pleasant and inspiring learning environmental brings the best out of everyone. I will be forever grateful to her faith in my capacity. I would like also to mention Dr. Stella van Beers for her support and encouragement. It was special to have her as a teacher and I appreciated working with her later at the Department of Biomedical Research.

I especially thank my parents, whom I love very much.

My last words are full of love and appreciation for the ones that had to resign from many things on my favor. My beloved family never complained and continuously supported me. It is extremely satisfying to have experienced the support from them. I felt how unlimited their love is and I am proud of having them. I have valued and appreciated the help my sons Conrado and Ricardo gave in the process of finalizing this thesis for printing. The respect to my work and the care to myself were intensively expressed by my husband João Alberto. Without his support and inner strength I could have never got so far. Especially I express my love and respect to João Alberto who encouraged me to stay working in the Netherlands in a project that stimulated me so much.
