Acknowledgements

I am particularly indebted to the Belgian Administration for Development Cooperation, for whom I have worked in the developing world since 1981, and who co-sponsored this research with the International Development Research Centre, Canada. I wish to especially thank Dr. Anwar Islam, former Senior Program Officer of this Centre and presently Associate Professor Health Systems Research at the Aga Khan University in Karachi, Pakistan, for his invaluable support, both moral and financial. Without his encouragements and constant attention towards the Health Systems Research Team and myself at ICDDR,B, it would have been hard to complete the study.

I am grateful to the ICDDR,B, the Centre for Health and Population Research, Bangladesh, where I found the opportunity to develop and conduct this study besides other studies in the field of health systems research.

I am thankful to Prof. Em. Mercenier and Van Balen of the Department of Public Health at the Institute of Tropical Medicine, Antwerp, Belgium. Their continuous guidance in my yearlong theoretical and field training in all possible aspects and the concept itself of health systems research constitute the basis of my understanding, both technical and political, of how to organise health care in a systems perspective.

Grateful thanks to Prof. Dr. A.S. Muller and Prof. Dr. G.J.R. Carrin, my Advisers, who sharpened my critical thinking with their stimulating teachings, comments and who with their encouragement assisted me in completing this dissertation. My special thanks to Dr. Lucy Gilson of the Centre for Health Policy, Witwatersrand University, South-Africa, for her contribution on earlier drafts. I also address my thanks to Dr. Sushila Zeitlyn who contributed to the cognitive part of the study, and to Dr. Jacques Myaux for his contribution in the sampling and screening stages of the field work. I am indebted to Mr. Kent Buse for editing earlier drafts of the dissertation and to Mr. Rob Yates and Mr. Steve Rice for editing the final version.

Last but not the least, I wish to thank all those who participated in the fieldwork, data management and entry, and data cleaning and analysis. I particularly like to recognise the contributions of my two Bangladeshi co-investigators, Ms Rabeya Rowshan and Dr Ishiq Bashir, who were in charge of the follow-up of the fieldwork and of data coding. They provided me with useful insight in health care delivery and policy in Bangladesh. In the same vein, I like to express my deep appreciation for and gratitude to Mr. Nazmul Sohel, the study data manager, who assisted in all aspects of data management, programming and analysis.
