Acknowledgements

I have had the unique opportunity to pursue my main interests over the past years. This privilege I mainly owe to my sponsor Kas Clearing who has given me the financial and technical support to consider the dynamics of price formation on both an academic and a more practically oriented level. In this respect I am foremost indebted to Joost Geurts who has played a key role at the beginning of the project and over the past years. Without his commitment I would have been building robots instead (second best choice). I owe you!

I am also greatly indebted to my thesis supervisor, Arnoud Boot. He facilitated my position at the university, enabling me to combine my interests, yet encouraged me to work day and night. I also thank him for guiding me in the right direction and for motivating me to try to become an economist.

My work additionally profited from the comments of a number of other people. In particular, I want to thank Utpal Bhattacharya for his thorough consideration of my work, and I am honored to have benefited from the helpful suggestions of Michael Brennan. I also want to thank the other members of the promotion committee, professors Cars Hommes, Enrico Perotti and Ton Vorst for their willingness to consider my work.

In the process of writing this dissertation I worked at both Kas Clearing and the University of Amsterdam. At Kas Clearing, I want to thank the ‘automatiseringsafdeling’ for all the technical support, Ab ter Horst for his important role in the early stages of the project, and Ed Meulenbroek for giving me the opportunity to start my own business.

I have been very lucky to work at the finance group at University of Amsterdam. I have enjoyed the presence of many great people. Let me thank them all, and in particular Netty Coolen, Ben Jacobsen, Jeroen Ligterink and Enrico Perotti. And of course, let me thank Pieter ‘Pierrewaaijer’ van Oijen. Being both a very close friend and colleague, he has made this period even more lively and fun. Cheers, Pier!

I also want to thank myself for applying my tremendously superb, award winning teaching talents to conquer Uneke. I thank her yet even more for the love and support in the years that followed. Finally, I want to dedicate this work to my parents for their unlimited confidence in me and for everything else really.

Pieter van Hasselt

Amsterdam, July 1999
A great many people have been looking to answer the question: why are women more prone to certain diseases? The answer may lie in the fact that women tend to have certain hormones at different stages of their lives that can affect their health.

For example, during pregnancy, women are at a higher risk of developing gestational diabetes and hypertension, which can lead to complications for both mother and child. In addition, women may experience a greater risk of heart disease due to the natural decline in estrogen levels as they age.

However, it's important to note that gender is just one factor that contributes to health outcomes. Other factors such as genetics, lifestyle, and environmental exposures also play a role.

In conclusion, while women may be more prone to certain diseases, it's essential to recognize that health outcomes are influenced by a wide range of factors. By understanding these factors and taking proactive steps to maintain good health, individuals can reduce their risk of developing chronic health conditions.
