Quantum optics and multiple scattering in dielectrics
Wubs, M.

Citation for published version (APA):
Contents

1 Introduction: quantum optics of photonic media .......................... 11
  1.1 Light in free space and in dielectrics .......................... 11
  1.2 Classical and quantum optics .................................. 12
  1.3 Elements of quantum optics in dielectrics ....................... 13
  1.4 Spontaneous emission .................................. 15
  1.5 Photonic media and photonic band gaps ...................... 16
  1.6 Multiple light scattering .................................. 17
  1.7 True modes of a beam splitter .......................... 19
  1.8 Outlook into this thesis .................................. 23

2 Scalar waves in finite crystals of plane scatterers ...................... 25
  2.1 Introduction .................................. 25
  2.2 Multiple-scattering theory for scalar waves ................. 27
  2.3 T-matrix formalism for plane scatterers .................. 30
    2.3.1 General properties of the single plane scatterer ........ 30
    2.3.2 N plane scatterers .................................. 31
    2.3.3 Model for the single plane scatterer ................ 33
  2.4 Optical modes .................................. 36
    2.4.1 Propagating modes .................................. 36
    2.4.2 Guided modes .................................. 37
  2.5 Local optical density of states .......................... 40
  2.6 Summary and conclusions .................................. 45

3 Spontaneous emission of vector waves in crystals of plane scatterers 47
  3.1 Multiple-scattering theory for vector waves . ............... 47
  3.2 Plane scatterers for vector waves .......................... 49
    3.2.1 Dyadic Green function in plane representation ........ 50
    3.2.2 Attempt to define a T-matrix ...................... 51
    3.2.3 Regularization of the Green function ................ 52
    3.2.4 T-matrix of a plane for vector waves ............... 54
    3.2.5 Transmission and energy conservation ................ 56
    3.2.6 T-matrix for N planes .................................. 57
    3.2.7 A model for the optical potential ............... 58
3.3 Optical modes and omnidirectional mirrors .......................... 59
3.3.1 Propagating modes .............................................. 59
3.3.2 Guided modes .................................................. 62
3.4 Spontaneous emission ............................................... 64
3.4.1 General theory applied to planes .............................. 64
3.4.2 Spontaneous emission near one plane scatterer .............. 65
3.4.3 Spontaneous emission near a ten-plane scatterer ......... 68
3.5 Radiative line shifts .............................................. 68
3.6 Conclusions and outlook .......................................... 71

4 Multipole interaction between atoms and their photonic environment 73
4.1 Introduction ....................................................... 73
4.2 Inhomogeneous dielectric without guest atoms ................. 74
4.2.1 Classical Lagrangian and Hamiltonian ...................... 74
4.2.2 Complete sets and quantum Hamiltonian ................... 76
4.3 Inhomogeneous dielectric with guest atoms .................... 80
4.3.1 Choice of suitable Lagrangian ............................... 81
4.3.2 Fixing the gauge ............................................. 82
4.4 The quantum multipolar interaction Hamiltonian .............. 84
4.4.1 Polarization, magnetization and displacement fields .... 84
4.4.2 Classical multipolar Lagrangian and Hamiltonian ....... 85
4.4.3 In need of a local-field model ............................... 87
4.4.4 Quantum multipolar interaction Hamiltonian ............ 89
4.4.5 Dipole approximation ......................................... 90
4.5 Inhomogeneous magnetic media .................................. 91
4.6 Dipole-coupling controversy .................................... 92
4.7 Summary and discussion ......................................... 93

5 Point scatterers and quantum optics in inhomogeneous dielectrics 95
5.1 Introduction ....................................................... 95
5.2 Atoms as point sources and as point scatterers ............... 96
5.2.1 The Hamiltonian ............................................. 97
5.2.2 Integrating out atomic dynamics ........................... 98
5.2.3 Volume-integrated dipole field .............................. 102
5.3 Single-atom properties altered by the medium ................ 103
5.3.1 Light emitted by a point source ............................ 104
5.3.2 Light scattered by a point scatterer ....................... 106
5.3.3 Single atom as a point source in “homogeneous” dielectric 107
5.4 Several atoms as point sources and scatterers ............... 110
5.5 Two-atom superradiance in inhomogeneous medium .......... 112
5.5.1 Motivation .................................................... 112
5.5.2 Calculation of the two-atom source Field ................. 113
5.5.3 Effects of two-atom superradiance ........................ 115
5.6 Two-atom superradiance in “homogeneous” dielectrics .... 116
5.7 Discussion: superradiance in photonic crystals ............... 118
## CONTENTS

5.8 Conclusions and outlook ........................................... 120

6 Transient QED effects in absorbing dielectrics ................. 123
  6.1 Introduction .................................................. 123
  6.2 The model and solutions of the equations of motion ........ 125
  6.3 Short-time limit: sum rules .................................. 128
  6.4 Long-time limit ............................................... 131
    6.4.1 Field and medium operators ............................ 131
    6.4.2 Relation with phenomenological theories ............... 132
  6.5 Model dielectric functions .................................. 134
    6.5.1 The Lorentz oscillator model ............................ 135
    6.5.2 The point-scattering model ............................. 136
  6.6 Spontaneous emission ......................................... 138
  6.7 Discussion and conclusions .................................. 142

A Analytical expression for T-matrix of N-plane crystal .......... 145

B Functional differentiation after choosing a gauge ............... 149
  B.1 Two definitions of functional derivatives ................. 149
  B.2 Simple rules to compute constrained functional
derivatives ....................................................... 150
  B.3 Functional derivatives of the minimal-coupling
Lagrangian ...................................................... 152

C Dyadic Green and delta functions ................................ 153

D Laplace operators and time-dependent coefficients .............. 155

References .................................................................. 157

Samenvatting voor iedereen (Dutch summary) ....................... 165

Dankwoord .............................................................. 171
