Subjects: Optical, X-ray, Binary, Neutron Star, Transient, Pulsar

On 2016 April 2nd, the MAXI/GSC nova-search system detected the start of a new X-ray outburst of the Be/X-ray transient SAX J2103.5+4545 (Atel #8912). Since then, we have been monitoring this outburst using Swift/XRT and UVOT pointings to study the outburst properties and how the source transited back into quiescence. The X-ray outbursts lasted approximately ~262 days and the source reached the lowest level on February 21st, 2017, with a no-detection observation where only 3 photons were collected in the source region using a total exposure time of 1 ksec. It gave a flux upper limit of  $\sim 1\text{E-}12$  erg/s/cm<sup>2</sup> (0.5- 10 keV; assuming an absorbed power-law shaped X-ray spectrum with a  $\text{NH}=1\text{E}22$  cm<sup>-2</sup> and a power-law index =1.4). On March 21st it was reported that the source increased in optical brightness again (Atel #10190). In our monitoring observations we found that also in the X-ray the source rebrightened between March 14th and March 21th in agreement with the reported start day of the renewed optical activity. We found that the unabsorbed X-ray flux increased one order of magnitude from  $\sim 5.3\text{E-}12$  to  $\sim 5.4\text{E-}11$  erg/s/cm<sup>2</sup>. However, during the next observation, performed on March 28th, the flux decreased to  $\sim 4.7\text{E-}12$  erg/s/cm<sup>2</sup>. Surprisingly, the next observation on April 4th shows a significant increase of the flux again to  $\sim 6.3\text{E-}11$  erg/s/cm<sup>2</sup>, instead of a source decaying to quiescence. The NH varied between  $\sim 1\text{E}21$  and  $\sim 1.6\text{E}22$  cm<sup>-2</sup> during our those last few observations and, the photon index between  $\sim 0.1$  and  $\sim 1.5$ . We also obtained simultaneous U, B, and V observations of the source using the Swift/UVOT. The source is clearly detected in all bands but we do not find any variability. The magnitudes (in the Vega system of reference) of the source were  $\sim 14.9$  (U),  $\sim 15.0$  (B) and  $\sim 13.8$  (V). Further Swift monitoring observations of SAXJ2103.5+4545 are planned to study the behavior of the source. We thank to the Swift PI for approving our ToO observations of SAXJ2103.5+4545.
