Acknowledgments ............................................................................................................. 1

I. General introduction ..................................................................................................... 3

II. Factors predisposing for cancer development

Chapter 1. A 20-year perspective on the International Fanconi Anemia
Registry (IFAR) ............................................................................................................. 39

Chapter 2. High incidence of head and neck squamous cell carcinoma in
patients with Fanconi anemia ...................................................................................... 59

Chapter 3. Human papillomavirus DNA and p53 polymorphisms in squamous
cell carcinomas from Fanconi anemia patients ......................................................... 75

Chapter 4. Spindle assembly checkpoint defects and chromosomal instability
in head and neck squamous cell carcinoma .................................................................. 85

Chapter 5. Chromosomal aberrations in patients with head and neck squamous
cell carcinoma do not vary based on severity of tobacco/alcohol
exposure ......................................................................................................................... 103

Chapter 6. Molecular-cytogenetic characterization of Chernobyl-associated
thyroid neoplasia in children ........................................................................................ 113

III. Identification of molecular profiles predictive of tumor behavior

Chapter 7 Spectral karyotyping analysis of head and neck squamous cell
carcinoma ....................................................................................................................... 127

Chapter 8. Genetic abnormalities associated with nodal metastasis in head
and neck cancer ............................................................................................................. 139

Chapter 9. Genome-wide screening for radiation response factors in head
and neck cancer ............................................................................................................. 151

Chapter 10. Identification of novel prognosticators of outcome in squamous cell
carcinoma of the head and neck .................................................................................. 163

Chapter 11. Prediction of chemoresponse in laryngopharyngeal cancer by
hierarchical clustering based on combined biological parameters .......................... 177

Chapter 12. Molecular classification of head and neck squamous cell carcinoma
using cDNA microarrays .............................................................................................. 191

Chapter 13. Molecular profiling of tumor progression in head and neck cancer ....... 207

Chapter 14. Gene expression profiling allows distinction between primary and
metastatic squamous cell carcinomas of the lung ...................................................... 241

Chapter 15. Genome-wide appraisal of thyroid cancer progression ....................... 257

Chapter 16. Screening for genetic aberrations in papillary thyroid cancer by
using comparative genomic hybridization ................................................................. 273

Chapter 17. Follicular variant of papillary thyroid carcinoma: Genome-wide
appraisal of a controversial entity .............................................................................. 285

IV. Identification of critical changes from the background of “passenger
mutations” in head and neck cancer

Chapter 18. Molecular cytogenetic characterization of head and neck squamous
cell carcinoma and refinement of 3q amplification .................................................. 301

Chapter 19. Amplification of the 3q26.3 locus is associated with progression to
invasive cancer and is a negative prognostic factor in head
and neck squamous cell carcinomas ......................................................................... 319
Chapter 20.  

*p53* regulates cell survival by inhibiting *PIK3CA* in squamous cell carcinomas ......................................................... 333

Chapter 21.  

Modulation of hedgehog signaling by the novel oncogene *SCCRO (Squamous Cell Carcinoma Related Oncogene)* leads to squamous cell carcinogenesis ......................................................... 351

Chapter 22.  

The role of novel oncogenes *Squamous Cell Carcinoma-related Oncogene* and phosphatidylinositol 3-kinase p110α in squamous cell carcinoma of the oral tongue ......................................................... 377

Chapter 23.  

*Squamous Cell Carcinoma Related Oncogene (SCCRO)* regulates angiogenesis through vascular endothelial growth factor-A ................. 391

Chapter 24  

*Squamous Cell Carcinoma Related Oncogene (SCCRO)* is highly expressed in developing, normal, and adenomatous adrenal tissue but not in aggressive adrenocortical carcinomas (ACC) ................. 401

Chapter 25  

Genome-wide profiling of papillary thyroid cancer identifies *MUC1* as an independent prognostic marker ......................................................... 413

V.  

General discussion ......................................................... 435
