Table. Performance objectives, selected change objectives, theoretical methods and practical strategies for program outcome 1 “adolescents control their dental plaque levels by improving their tooth-brushing frequency and duration”.

| **PO1** Adolescents decide to prevent dental diseases and to change their tooth-brushing behavior. | **Theoretical methods/ BCTs * Requirements Practical strategies** |
|---|---|---|
| **Change objectives (determinant)** | Adolescents are aware of their susceptibility to dental diseases (risk-perception). Adolescents are able to describe their tooth-brushing behavior (awareness). | **Adolescents need to possess some sub-skills (they need to know how to use the disclosing tablets and take a selfie).** Feedback needs to be personal and specific. | **In the orthodontic clinic (upon installing the app), a dental hygienist demonstrates how to use the disclosing tablets to visualize plaque and how to take a selfie. To provide feedback, information on adolescents’ oral health behavior and dental plaque levels will be collected. Adolescents will first be asked to answer to questions with regard to their oral health behavior. Next, adolescents are asked to use disclosing tablets to visualize the dental plaque. After they use the tablets, they are asked to take a selfie of their teeth with the visualized plaque (red color). The app presents an example of a selfie and the selfie will be stored on the main page of the app. The app asks them to click where the plaque is present on the selfie. Based on the number of clicks and registration questions, the app provides feedback on their dental plaque levels and oral health behavior, and provides oral health advice.** |
| **Adolescents know what good oral health is and its association with dental plaque (knowledge). Adolescents acknowledge the risk of not brushing teeth as recommended and its consequences (risk-perception & outcome expectancies). Adolescents know the benefits of maintaining good oral health (outcome expectancies).** | **- Providing feedback on behavior (BCT 2.2): i.e., monitoring and providing informative or evaluative feedback on performance of behavior [1, 2]. - Using disclosing tablets to visualize and evaluate dental plaque [3]. - Providing feedback on outcome (BCT 2.7): i.e., monitoring and providing feedback on the outcome of the behavior [1, 2].** | **There must be a plausible scenario with a cause and an outcome. The message must be easy to understand: any use of imagery or movies must be relevant and must not diverge too much from the target group’s experience.** | **The app provides information on the importance on tooth brushing as recommended in a short animated movie. The movie explains that not brushing teeth can increase the risk of getting dental diseases (how plaque can cause dental diseases) and can also affect appearance. The movie provides information on the positive outcomes of maintaining good oral health. It shows two scenarios: (1) bad oral hygiene causes white spot lesions/dental caries; (2) good oral hygiene causes white and beautiful teeth.** |
| **- Providing information on health consequences (BCT 5.1) (e.g. written, verbal, visual): i.e., providing information on health consequences of performing the behavior) [2]. - Belief selection: i.e., using messages designed to strengthen positive beliefs, weaken negative beliefs, and introduce new beliefs [1]. - Providing scenario-based risk information: i.e., providing information that may aid the construction of an image of the ways in future loss or accident.** | | | |
- Providing reinforcement: i.e., linking a behavior to any consequence that increases the rate, frequency and probability of the behavior [1].

- Providing instructions on how to perform the behavior (BCT 4.1): advise or agree on how to perform behavior (includes “skills training”) [2].

- Demonstrating the behavior (BCT 6.1): i.e., providing an observable sample of the performance of the behavior, directly in person or indirectly (e.g. through film) (includes “modeling” [1, 2].

The adolescents need to have a positive intention.

The app allows the adolescents to choose the tooth-brushing duration and/or frequency they would like to change and they think they can change.
includes implementation intentions: prompting making if-then plans that link situational cues with responses that are effective in attaining goals or desired outcomes [1]).

Adolescents show commitment to their goals (attitude).
- Behavioral contract (BCT 1.8): i.e., creating a written specification of the behavior to be performed, agreed by the person, and witnessed by another [2].

PO4 Adolescents change their tooth-brushing behavior.

<tbody>
<tr>
<td>Adolescents receive support during brushing on where and for how long to brush teeth (facilitator/support) .</td>
<td>- Providing practical support (BCT 3.2): i.e., advising on, arranging, or providing practical help for performance of the behavior [2]. - Providing technical assistance: i.e., providing technical means to achieve desired behavior [1].</td>
<td>The technical assistance must fit the recipient’s needs and resources.</td>
<td>The app provides technical means for achieving the desired tooth-brushing behavior, i.e., it incorporates a brushing timer. This provides practical support with brushing according to the 5-step method, showing each step during brushing.</td>
</tr>
<tr>
<td>Adolescents receive cues to tooth-brushing (cues to action, habit formation).</td>
<td>- Prompts/cues: i.e., introducing or defining environmental or social stimulus with the purpose of prompting or cueing the behavior. The prompt or cue would normally occur at the time or place of performance (BCT 7.1) [2].</td>
<td>Cues work best when people are allowed to select and provide their own cues.</td>
<td>The app has an option for setting reminders, which are sent as push-notifications that function as “cues to action”. The adolescents will be reminded to brush their teeth at a time that fits in with their daily routine.</td>
</tr>
</tbody>
</table>

PO5 Adolescents evaluate their tooth-brushing behavior, their dental plaque levels, and the effect of brushing on these levels.

corresponds to agreed tooth-brushing goals, and consider modifying goals accordingly (skills and goal pursuit). goal(s) jointly with the person and considering modifying goal(s) or behavior change strategy in the light of achievement. This may lead to re-setting the same goal, to a small change in that goal, or to setting a new goal rather than (or in addition to) the first; or to no change [2].

Discrepancy between the current behavior and goal (BCT 1.6): i.e., drawing attention to discrepancies between a person’s current behavior (in term of the form, frequency, duration, and intensity of that behavior) and the person’s previously set outcome goals or action plans (goes beyond self-monitoring of behavior).

Adolescents monitor their dental plaque levels (awareness, self-regulatory skills) and compare it with goal (awareness, self-regulatory skills).

- Using disclosing tablets to visualize and evaluate dental plaque [2].
- Prompting self-monitoring of the outcome of the behavior (BCT 2.4): i.e., establishing a method for the person to monitor and record the outcome(s) of their behavior as part of a behavior-change strategy [2].
- Providing feedback on the outcome of behavior (BCT 2.7): i.e., monitoring and providing feedback on the outcome of the behavior [1, 2].

Adolescents need to possess the sub-skill: identifying which dental surfaces are clean and which are covered with dental plaque.

- Problem solving/prompt barrier identification (BCT 1.2): i.e., analyzing, or prompting the person to analyze, factors influencing the behavior, and

If a person’s goal has not been achieved, volitional help sheets will be presented to help them identify barriers preventing them from proper tooth brushing and their possible solutions. The results of this volitional help sheets are presented as their.

BCT: Behavior Change Technique; PO: Performance objectives.

* Many methods have clearly been defined, linked with theories of behavior change and classified into internationally recognized taxonomies of behavior-change techniques [1, 2]. These taxonomies were used to code the content of the program with standardized definitions of the behavior-change techniques (BCT's) classified by these taxonomies [2].
