It will be obvious that the accomplishment of any promotion work is never done by one single person, videlicet the author’s name on the cover. Therefore, one of the most important parts in rounding off a thesis is to ascribe credits to those people who deserve it and cannot be left out of consideration. Regarding this, the first name to think about is the one of my promoter Prof. R. Krishna, who directed me (and my project) with proper specialized knowledge. I’m very grateful for having participated in his research-group and for all the opportunities he gave me for life.

The next person who cannot be set aside is my colleague and friend Richard Baur. Scientifically, he helped me among other things with the implementation of our developed NEQ stage model into the simulation environment ChemSep. Socially, I enjoyed the many ‘smoke’ conversations we held and the several last beers we drank before six o’clock. But so much the more, I will never forget his help with the conifers transportation.

Another associate during the mentioned ‘smoke’ breaks was Jasper van Baten. I have always liked his typical opinions about all kinds of matters. Besides, I am very appreciative for all the time he spend on my computer in order to keep it running well.

A major part of my work consisted of experimental work performed in our laboratory. I would like to thank Jürg Ellenberger (who is responsible and taking care of all the equipment in the lab) for helping me out to solve all the difficulties we experienced during the experiments and for the preparation and start up of the complete experimental set-up.

Last but not least, I would like to mention the following close colleagues; Jose Angel Ojeda Nava and Chippla Vandu. They have been nice people to work with and good company during the several lunches.

During my promotion work, I have been quite fortunate to receive great assistance of three graduate student. Especially considering the experimental work, they achieved many useful experimental results and therefore facilitated my work enormously.

Barbara Buttinger from Austria was the first student and performed many great experiments on the water – ethanol – acetone mixture. Besides, she brought lots of joy into our group with her always cheerful trait. The next graduate was Nina Borcean coming from Toulouse. She managed to fulfil many experiments in a short time on the water – ethanol – methanol mixture. Finally, Sander van der Molen joined our group to fulfil his practical training for the H.T.S. Amsterdam at first and his internship for the University of Amsterdam later on. Therefore, he performed excellent work on a number of mixtures.

For the performance of simulations, I’m very grateful to R. Taylor and H. Kooijman for providing the code to ChemSep, which was used in this study after appropriate modification to include the rigid bubble model. Besides, I would like to thank the previous and A.P. Higler as well for providing the code to perform the three-phase distillation NEQ and EQ model calculations, reported in this work.
Next to colleagues, students and others who accompanied me in my working environment, I would also like to thank my relatives and friends from my private-life who supported me in all kinds of ways over the last couple of years.

In particular to mention is Dirk Visser; a close friend since kindergarten. After twelve years of ‘isolation’ in Marken, we went to high school together in Amsterdam and next studied both Chemical Technology on the University of Amsterdam. Today, we are still colleagues and making lots of fun next to our jobs, which I think we should do for another long .. long time together with all our other friends. In the end, those times of fun kept, and will keep us going.

Penultimate, I want to name and thank my parents for their great upbringing, love and support. Together with my two sisters Esther and Daniëlle, they provided a superb base for life, which is probably more appreciated than they realize.

Finally, I want to say many thanks to my girlfriend and life companion Tanja. “Besides making my life magnificent, you also gave me the most beautiful gift: Jiddo”!

The author acknowledges a grant from the Netherlands Organization for Scientific Research (NWO), Chemical Sciences Division (CW), for investigations on three-phase distillation.
