Epilogue

I wish to express my gratitude to all those who have contributed in any way to the completion of this thesis. The presented research was carried out at the Department of Cariology and Endodontics (School of Dentistry, University of Geneva) and at the Academisch Centrum Tandheelkunde Amsterdam (ACTA). The cooperation and support of many individuals helped to make this work possible. Included among these are:

Prof. Dr. Carel Davidson, who as my promoter provided guidance, support and encouragement. I want to thank him for having initiated this collaboration project. Since I had the chance to meet him he has been for me a highly respected mentor through his numerous publications, innovative ideas, expertise in the field of composites as well as his scientific vision. His human qualities, limitless enthusiasm, generosity and support make him also a very dear friend.

Prof. Ivo Krejci, director of the Cariology and Endodontics Department, who also offered his support and guidance in the development of the fatigue machine used in this work. A special thank to him as well for his personal support and for attributing me the time necessary to complete this work.

Prof. Jacques Holz, former director of the Department Restorative Dentistry and Endodontics at University of Geneva, for teaching me the precision and scientific thinking which guided my professional life and made it so interesting.

Ms Marie-Claude Reymond, SEM technician, for his help during the preparation and observation of the countless replicas used in the present work.

My brother Dr. Jean-Michel Dietschi for his help; without this invaluable support at our private office, the present work would have never been achieved.

Drs Luca Moor, Giovanni Bindi, Deborah Herzfeld, Steven Olsburg and Manuela Monasevic for their important contribution to the fabrication and testing of the samples.
