Acknowledgements

I am extremely grateful to René de la Rie, head of the scientific research department at the National Gallery of Art, Washington DC, for giving me the opportunity to carry out this research as a doctoral degree under his supervision, and for his inspiring guidance and encouragement throughout the project. Many of my colleagues in the scientific research department and conservation division of the Gallery have given me help and advice through the course of my research, as well as having been great friends during my time in DC. Among those who deserve special thanks are Suzanne Lomax, who from the start of the project provided me with much needed instruction in GC and other analytical techniques, and has been invariably generous and patient in dispensing practical advice; and Nobuko Shibayama, who developed and applied LCMS methods to the analysis of solvent extract samples during her Mellon Fellowship at the Gallery. Her contribution to the project, and her enthusiasm as a co-worker, are greatly appreciated. Other colleagues in the scientific research department have been a great help in assisting with experiments and giving advice at various stages in the project, especially Chris Maines, Michael Palmer, Barbara Berrie, Lisha Glinsman, and former members of the department Jill Whitten, Siobhan Watts and Joe Swider. In addition, members of the painting conservation department provided me with much helpful advice on practical conservation questions. I must also thank Ross Merrill, chief of conservation, for being highly supportive of my research at the Gallery.

I am grateful to have had the opportunity to spend periods researching in the Netherlands as part of the MOLART project. I was always made to feel very welcome on my visits there, and it was a pleasure to work with my MOLART friends and colleagues, from whose expertise I benefited greatly. Prof. Dr. Jaap Boon made it possible for me to spend time working at the FOM Institute, Amsterdam, and gave me a good deal of useful advice on analytical problems. Klaas Jan van den Berg, Jorrit van den Berg and Gisela van der Doelen have been particularly helpful, in our numerous discussions of research issues, as well as more practical matters – such as introducing me to the “art” of DTMS, and helping me to decipher the (initially bewildering) data. Thanks are also due to Jerre van der Horst and Leo Spetter, for providing technical support during my experiments at FOM.
Acknowledgements

I owe thanks to Anne van Grevenstein and René Hoppenbrouwers, for their support and interest in the project, and for providing me with the opportunity to carry out experiments in conjunction with the conservation of paintings from the Oranjezaal (Huis ten Bosch, Den Haag). Along with Ruth Jongsma, Mireille te Marvelde, Lidwien Speeleers and others in the Oranjezaal group, they provided valuable input and assistance with the investigations, as well as insight into conservation issues. I also thank Anne for the generous hospitality she showed me on my visits to Den Haag.

I have been fortunate to be able to collaborate with colleagues from other institutions in the course of this project. In particular, Alan Phenix, with whom I collaborated at the Courtauld Institute of Art and the FOM Institute, and Michael Schilling at the Getty Conservation Institute, have given me much useful help and advice. Mr. Raymond White at the National Gallery, London; Dr. Aviva Burnstock at the Courtauld Institute; Dr. David Erhardt at the Smithsonian Center for Materials Research and Education (formerly the Smithsonian Conservation Analytical Laboratory); and Dr. Nathan Stolow – whose pioneering studies of solvent effects were a particular inspiration for this project – are also among those with whom I have had rewarding discussions on various aspects of the research. Marie Louise Sauerberg and Dr. Spike Bucklow at the Hamilton Kerr Institute kindly provided me with paint samples from the Westminster Retable for analysis, and gave me useful information on the materials of the painting.

In addition to those already mentioned, Melanie Gifford, Michael Swicklik and Cathy Metzger in the conservation division of the National Gallery of Art are among those who obligingly read and re-read drafts of chapters, and provided helpful comments and suggestions. Ted Dalziel and Thomas McGill in the Gallery’s library are also to be thanked for tracking down countless references, including numerous obscure and poorly cited ones.

A final, special word of thanks to my family and friends in Britain, for their support and encouragement (and visits) during my time in Washington DC.
