You will be contacted as soon as possible.

## The Invalid Directive

The invalid directive is a common error that occurs when the compiler encounters a directive that it does not recognize. This can happen for a variety of reasons, such as a typo in the directive name, a missing semicolon, or a directive that is not supported by the compiler. The error message typically looks like this:

```
error: invalid directive 'xxx'
xxx
^
```

The error message indicates the line number where the error occurred and the directive that caused the problem. In this case, the error is on line 1, and the directive is 'xxx'. The caret (^) points to the end of the line, indicating the location of the error.

To resolve this error, you need to check the directive name and make sure it is spelled correctly. If the directive is not supported by the compiler, you may need to use a different directive or a different compiler. For example, if you are using the `__asm__` directive and the compiler does not support it, you may need to use the `asm` directive instead.

Another common cause of the invalid directive error is a missing semicolon at the end of the directive. The compiler expects a semicolon to terminate the directive, and if it is missing, the compiler will not recognize the directive. To fix this, simply add a semicolon at the end of the line.
