The search for the right question is a task, which cannot be completed alone. For guidance in this search I would like to thank all people who helped me in any way. The following people I would like to thank in special.

Prof P.P. Tak, who is the main person responsible for getting me into this research. Paul-Peter, your almost business like management style and never lasting support, combined with the freedom to develop my own ideas, are among the many things I would like to thank you for.

Without the endless patience of Dr. B.J. Baum and Stanley Pillemer, my mentors at the NIH, this task could not have been completed. Dear Stanley, your teaching and clinical skills combined with your knowledge about SS patients is what helped me most. You became a good friend and sparring partner not only in the clinic but also in one of the many pubs around the States. Dear Bruce, your sincere interest and never ending enthusiasm for discussion, and your inspiring way of teaching, is what I admire. Without your excellent writing skills and patiently explained corrections, my writing skills wouldn't have improved that much.

All the hospitality and friendships from my colleagues at the Gene Transfer & Therapeutics Branch is still the reason I sometimes feel a little "homesick". Dear Roberta, where would we be without your "cookies alert"? The invaluable management skills of miss Avis and Karin gave serious release on the massive amount of paperwork we had to fill in as "aliens".

I will always have warm memories to my friends in the gene transfer section in particular. Corinne "don't touch my stuff", I still miss you. Changyu, if you weren't there to help me with the experiments, always two steps ahead, I would still be working on my thesis. Antonis, my friend, you learned me so much not only about research but also about the Greek way of life and not to forget you always kept me updated from the latest political developments in Greece. Simon thank you for showing me that successful research not only involves great ideas and experiments but also good management. Maybe our dream to start our own company will once come thru.

Ladies of 1N114, for me you were the biggest challenge after all! Dear Beatrijs, Anna and Vidya, you are still wonderful friends after working together at 9m² for such a long time. Not only did I learn a lot about a dry mouth, you also kept me well informed about the latest fashion and sales. Our 24-hour research mission in combination with spontaneous sailing trips and pub visits I will never forget.
Without all the Dutch friends visiting us, sharing experiences and bringing authentic Dutch joy, it would have been pretty lonely out there in the “Big US of A”; thank you very much.

At the KIR I was lucky to find Margriet, Pol and Sander as direct colleagues in the gene transfer section. Not only scientifically were you very helpful, you also knew exactly the places to be outside the AMC. Sander and Pol, you were very helpful at the stressful moment of finishing this thesis, while I was already back in the clinic, especially the sense of humour we share!

Thomas, thank you for your quick editorial remarks as a non-insider in the field, I promise I will be on time.

Dear mother, without your and pappa’s never ending support this would not have been possible; thank you so much!

Brenda, I admire you for your endless love and patience, soon there will be a new chapter!
