Contents

1 General introduction **1**

2 Friction **5**
2.1 Introduction to sliding friction 5
2.2 The Burridge-Knopoff model 7
2.3 References 11

3 Transition to solitary motion in the BK model of multicontact friction **13**
3.1 Introduction 13
3.2 The BK model 14
3.3 Solitary versus collective motion 17
3.4 Stability of the solitary state 21
3.5 Summary and conclusions 23
3.A Derivation of parameters 25
3.B Integrating the equations of motion 28
3.C Features of the solitary state 29
3.C.1 Motion of the blocks in the solitary state 29
3.C.2 Friction force as a function of driving velocity in the solitary state 31
3.C.3 Characterizing the structure of the solitary state 33
3.D Creating a solitary state 36
3.D.1 Determining block positions from the forces 37
3.E An outlook on the BK model of multicontact friction; directed percolation 42
3.6 References 44

4 Logarithmic relaxation due to minimization of interactions in the BK model **45**
4.1 Introduction 45
4.2 The BK model of multicontact friction 47
4.3 Stress relaxation at finite temperature 50
4.4 Summary and conclusions 55
4.A Analytical approximations of the stress relaxation 58
4.5 References 60

5 Phase transition by nucleus growth **61**
5.1 Phases of liquid crystals . . . 61
5.2 Order parameters . . . 62
5.3 The Landau expansion of the free energy . . . 63
5.4 Spatially inhomogeneous systems . . . 67
5.5 Temperature and latent heat . . . 68
5.6 References . . . 70

6 Influence of latent heat and thermal diffusion on the growth of nematic nuclei **71**
6.1 Introduction . . . 71
6.2 Order parameter and coupling to a temperature field . . . 73
6.3 Multiscale approach . . . 74
6.4 Results . . . 77
6.5 Summary and conclusions . . . 81
6.A Shape and velocity of the order parameter profile . . . 82
6.A.1 Latent heat . . . 85
6.B Comparison to classical nucleation theory . . . 86
6.C The coupled equations . . . 88
6.C.1 The order parameter evolution equation . . . 88
6.C.2 The thermal diffusion equation . . . 89
6.C.3 Coupling the equations, and making them dimensionless . . . 90
6.C.4 Relating the parameters to experiments . . . 90
6.D Numerical techniques . . . 91
6.D.1 General discretization . . . 91
6.D.2 Numerically integrating m and u . . . 92
6.D.3 The semi-analytical approach . . . 93
6.E Comparison to experiments . . . 94
6.6 References . . . 102

7 The self-assembly of patchy particles **103**
7.1 Introduction to self-assembly . . . 103
7.2 Patchy particles . . . 104
7.3 References . . . 108

8 Phase transition to bundles of flexible fibers **109**
8.A Equilibrium polymerization . . . 118
8.A.1 The partition function and the free energy . . . 118
8.A.2 The grand potential and the distribution of polymer lengths . . . 119
8.A.3 The chemical potential, the pressure and the ideal limits . . . 121
8.B Ideal polymer sublimation . . . 122
8.B.1 The Einstein crystal . . . 123
8.B.2 The Wertheim thermodynamic perturbation theory . . . 124

8.C The bending rigidity of a polymer chain 125
8.D Quaternions, and their use in Monte Carlo simulations 127
8.D.1 Randomizing quaternions 129
8.D.2 Reptation moves 129
8.1 References 131

Summary **133**

Samenvatting **137**
