If you believe that digital publication of certain material infringes any of your rights or (privacy) interests, please let the Library know, stating your reasons. In case of a legitimate complaint, the Library will make the material inaccessible and/or remove it from the website. Please Ask the Library: https://uba.uva.nl/en/contact, or a letter to: Library of the University of Amsterdam, Secretariat, Singel 425, 1012 WP Amsterdam, The Netherlands. You will be contacted as soon as possible.
## Contents

Acknowledgments xi

1 Introduction 1  
1.1 Limits on fault-tolerant computation 2  
1.1.1 Limits on fault-tolerant classical computation 8  
1.2 Entanglement and interactive proof systems 10  
1.2.1 Repetition of XOR games 10  
1.2.2 Limits on non-locality 13  

2 Preliminaries 17  
2.1 Linear algebra notation 17  
2.2 Quantum states, operations and computation 19  
2.2.1 Quantum circuits and quantum computation 21  
2.3 Complexity classes 23  
2.4 Communication complexity 25  
2.5 Bloch sphere 27  
2.5.1 Pauli matrices 27  
2.5.2 Bloch-vector representation 27  
2.6 Semidefinite programming 28  

I Limits on noisy quantum and classical computation 31  

3 Erasure noise 33  
3.1 Erasure vs. depolarizing noise 34  
3.2 Circuit model 35  
3.3 Noise threshold 37  
3.4 Discussion 41
7.1.2 Organization .................................................. 99
7.2 Background and definitions ........................................... 99
  7.2.1 More on interactive proof systems .............................. 99
  7.2.2 XOR games .................................................. 101
  7.2.3 XOR games and non-locality ................................. 102
7.3 Characterization of quantum XOR games ............................ 102
7.4 Additivity theorem ............................................... 105
7.5 Parallel repetition theorem ........................................ 107
7.6 Discussion ..................................................... 110
  7.6.1 Perfect parallel repetition of classical XOR games ............ 110
  7.6.2 Parallel repetition of general games .......................... 110
  7.6.3 Feige-Lovász games ......................................... 111

8 Limits on non-locality from communication complexity ............ 113
  8.1 Introduction .................................................... 113
  8.2 Non-local boxes ................................................ 116
  8.3 Main result ..................................................... 118
  8.4 Proof .......................................................... 118
    8.4.1 Distributed computation .................................. 119
    8.4.2 Bias Amplification ........................................ 120
  8.5 Discussion ..................................................... 123
    8.5.1 One NLB for majority ..................................... 123
    8.5.2 Fault-tolerance threshold ................................. 123

A Some more facts about Linear algebra ................................. 125

B Convex hull of all 1-qubit Clifford operations ....................... 129
  8.1 Preliminaries about the Clifford matrices ....................... 129
  8.2 The case $|\mathcal{R}_F \cap \mathcal{C}_\sigma| = 3$ for some $\sigma \in \text{Sym}(3)$ ..... 131
  8.3 The case $|\mathcal{R}_F \cap \mathcal{C}_\sigma| \leq 2$ for all $\sigma \in \text{Sym}(3)$ .......... 134

C Classical entanglement-assisted communication complexity of inner product ........................................ 137

D Tsirelson’s vector characterization of XOR games .................. 139

Bibliography .......................................................... 143
Index ........................................................................... 151
Samenvatting .................................................................. 153
Abstract ........................................................................ 157
