J. Japelj (Uni. Amsterdam), D. A. Kann (HETH/IAA-CSIC), A. de Ugarte Postigo (HETH/IAA-CSIC, DARK/NBI), L. Izzo (HETH/IAA-CSIC), J. P. U. Fynbo (DAWN/NBI and DAWN/DTU), D. B. Malesani (DTU Space), V. D'Elia (SSDC), N. R. Tanvir (Univ. Leicester), S. D. Vergani (CNRS -GEPI/Observatoire de Paris), G. Pugliese, L. Kaper (Uni. Amsterdam) report on behalf of the Stargate collaboration:

We observed the optical counterpart (Siegel et al., GCN 24889; Pozanenko et al., GCN 24892) of GRB 190627A (Sonbas et al., GCN 24888) with the ESO VLT UT1 equipped with the FORS2 spectrograph. We obtained a 30 min spectrum with the 600RI (512 - 845 nm) and a 30 min spectrum with the 600z (737-1070 nm) grism. Observations started at 01:12:41 UT on June 30 (i.e., 2.57 days after the GRB detection).

In the spectrum, the continuum is clearly detected. We detect three MgII absorption systems at redshifts $z = 1.942$, 1.774 and 1.681 . The redshift $z = 1.942$ and 1.681 absorption systems also exhibit FeII lines. We conclude that $z = 1.942$ is the likely redshift of GRB 190627A.

We acknowledge the ESO observing staff at Paranal, especially Karleyne Silva and Juan Carlos Munoz.
