AN EXAMPLE CONCERNING SADULLAEV'S BOUNDARY RELATIVE EXTREMAL FUNCTIONS

JAN WIEGERINCK

In memory of Józef Siciak

Abstract. We exhibit a smoothly bounded domain Ω with the property that for suitable $K \subset \partial\Omega$ and $z \in \Omega$ the *Sadullaev boundary relative extremal functions* satisfy the inequality $\omega_1(z,K,\Omega) < \omega_2(z,K,\Omega) \leqslant \omega(z,K,\Omega)$.

1. Introduction

In [5] Sadullaev introduced several so-called *boundary relative extremal functions* for compact sets K in the boundary of domains $D \subset \mathbb{C}^n$, and asked whether their regularizations are perhaps always equal. Recently Djire and the author [1, 2] gave a positive answer in certain cases where D and K are particularly nice.

In this note we show that in general equality does not hold. The example is formed by a suitable compact set in the boundary of the domain Ω that was constructed by Fornæss and the author [3] as an example of a domain D where bounded plurisubharmonic functions that are continuous on D cannot be approximated by plurisubharmonic functions that are continuous on $\overline{D}$. We start by briefly recalling the definitions of boundary relative extremal functions and the construction of the domain Ω.

1.1. **Boundary relative extremal functions.** We follow Sadullaev [5, Section 27]. Let D be a domain with smooth boundary in $\mathbb{C}^n$, $\xi \in \partial D$, and $A_\alpha(\xi) = \{z \in D; |z-\xi| < \alpha\delta_\xi(z)\}$, where $\alpha \geqslant 1$ and $\delta_\xi(z)$ is the distance from z to the tangent plane at ξ to ∂D. For a function u defined on D, put

$$\tilde{u}(\xi) = \sup_{\alpha>1} \limsup_{\substack{z\to\xi \\ z\in A_\alpha(\xi)}} u(z), \quad \xi \in \partial D.$$

Definition 1.1. Let $\mathrm{PSH}(D)$ denote the plurisubharmonic functions on D and let $K \subset \partial D$ be compact. We define the following *boundary relative extremal functions*

(1)
$$\omega(z,K,D) = \sup\{u(z) : u \in \mathrm{PSH}(D), u \leqslant 0, \tilde{u}|_K \leqslant -1\};$$

(2)
$$\omega_1(z,K,D) = \sup\{u(z) : u \in \mathrm{PSH}(D) \cap C(\overline{D}), u \leqslant 0, u|_K \leqslant -1\};$$

(3)
$$\omega_2(z,K,D) = \sup\{u(z) : u \in \mathrm{PSH}(D), u \leqslant 0, \limsup_{\substack{z\to\xi \\ z\in D}} \leqslant -1, \text{ for all } \xi \in K\}.$$

The upper semi-continuous regularization u^* of a function u on a domain D is defined as

$$u^*(z) = \limsup_{w\to z}\{u(w)\}.$$

The functions ω^*, ω_1^*, ω_2^* are plurisubharmonic. Observing that $\omega_1(z,K,D) \leqslant \omega_2(z,K,D) \leqslant \omega(z,K,D)$, Sadullaev's question is *for what j is $\omega^*(z,K,D) \equiv \omega_j^*(z,K,D)$?*

Key words and phrases. plurisubharmonic function; boundary relative extremal function.

1.2. **The domain Ω.** We briefly recall the construction and properties of the domain Ω from [3].

$$\Omega = \{(z, w) \in \mathbb{C}^2; |w - e^{i\varphi(|z|)}|^2 < r(|z|)\}. \tag{1.1}$$

Here r and φ are in $\mathbb{C}^\infty(\mathbb{R})$ with the following properties: $-1 \leqslant r \leqslant 2$; $r(t) \leqslant 0$ for $t \leqslant 1$ and for $t \geqslant 17$; $r(t) \equiv 1$ for $3 \leqslant t \leqslant 8$ and for $10 \leqslant t \leqslant 15$; $r(t)$ takes its maximum value $= 2$ precisely at $t = 2$, 9, and 16. Moreover, $r'(t) > 0$ on $1 \leqslant t < 2$, $8 < t < 9$ and $15 < t < 16$, while $f'(t) < 0$ on $2 < t < 3$, $9 < t < 10$, and $16 < t \leqslant 17$. Next φ satisfies $\varphi(t) < -\pi/2$ for $t \leqslant 4$ and for $t \geqslant 14$; $\varphi(t) > \pi/2 + 100$ for $5 \leqslant t \leqslant 6$ and for $12 \leqslant t \leqslant 13$ and $\varphi(t) < -\pi/2 + 100$ for $7 < t < 10$, and we demand in addition that $\varphi \leqslant 108$.

From [3] we recall that Ω is a Hartogs domain with smooth boundary, and that the annulus

$$A = \{(z, w); w = 0, 2 \leqslant |z| \leqslant 15\} \tag{1.2}$$

is contained in $\overline{\Omega}$.

2. Negative answer to Sadullaev's question

Theorem 2.1. *Let $K = \{(z, w \in \partial\Omega; |z| = 2$ or $|z| = 16\}$. Then*

$$\omega_1((z, w), K, \Omega) < \omega_2((z, w), K, \Omega)$$

for (z, w) in an open neighborhood of $\{w = 0, |z| = 9\}$.

Proof. Let $u \in \mathrm{PSH}(\Omega) \cap C(\overline{\Omega})$, $u \leqslant 0$, $u|_K \leqslant -1$. Then by the maximum principle, $|u| \leqslant -1$ on the discs $|w - e^{i\varphi(|z|)}| \leqslant 2$, where z is fixed and satisfies $|z| = 2$ or $|z| = 16$, and in particular on the circles $C_1(w) = \{(z, w) : |z| = 2\}$ and $C_2(w) = \{(z, w) : |z| = 16\}$, where $|w| < 1$. Because Ω is a smoothly bounded domain, it follows from [3, Theorem 1] (see also [4] for recent extensions of this theorem), that u can be approximated uniformly on $\overline{\Omega}$ by smooth plurisubharmonic functions v defined on shrinking neighborhoods of $\overline{\Omega}$.

Let $\Omega_\delta = \{\zeta \in \mathbb{C}^2; d(\zeta, \overline{\Omega}) < \delta\}$. Then given $\varepsilon > 0$, there exist $\delta > 0$ and $v \in \mathrm{PSH}(\Omega_\delta)$, such that $|u - v| < \varepsilon$ on $\overline{\Omega}$. For $|w| < \delta$ the annulus $A_w = \{(z, w) : 2 \leqslant |z| \leqslant 16\}$ is contained in Ω_δ. On its boundary, which equals $C_1(w) \cup C_2(w)$, we have that $v < -1 + \varepsilon$, hence this also holds on A_w. It follows that $u < -1 + 2\varepsilon$ on $A_w \cap \overline{\Omega}$, in particular $u < -1 + 2\varepsilon$ on the open set $V = \{(z, w) : 8 < |z| < 10, |w| < \delta, |w| < r(|z|) - 1\} \subset \Omega$. It follows that $\omega_1((z, w), K, \Omega) \leqslant -1 + 2\varepsilon$ on V, and therefore also $\omega_1^*((z, w), K, \Omega) \leqslant -1 + 2\varepsilon$ on V.

Next we will construct a plurisubharmonic function in the family that determines ω_2. The construction is as in [3, Section 2]. On $\Omega \cap (\{3 < |z| < 8\} \cup \{10 < |z| < 15\}$ there exists a continuous branch of $\arg w$, denoted by $h(z, w)$, such that

$$\varphi(z) - \pi/2 \leqslant h(z, w) \leqslant \varphi(z) + \pi/2.$$

In [3] we constructed the following plurisubharmonic function.

$$f(z, w) = \begin{cases} 0 & \text{if } |z| < 4 \text{ or if } |z| > 14 \\ \max\{0, h(z, w)\} & \text{if } 3 < |z| < 6 \text{ or if } 12 < |z| < 14 \\ \max\{100, h(z, w)\} & \text{if } 5 < |z| < 8 \text{ or if } 10 < |z| < 13 \\ 100 & \text{if } 7 < |z| < 11. \end{cases} \tag{2.1}$$

It satisfies $f \leqslant 110$ on Ω, $f \equiv 0$ on $\{|z| \leqslant 3\}$ and on $\{|z| \geqslant 14\}$, hence f extends continuously by 0 to $\overline{\Omega} \cap (\{|z| \leqslant 3\} \cup \{|z| \geqslant 14\})$, and $f = 100$ on V. The plurisubharmonic function g on Ω defined by

$$g(\zeta) = \frac{f(\zeta) - 110}{110}, \quad (\zeta = (z, w))$$

is negative, identically equal to -1 on $\overline{\Omega} \cap (\{|z| \leqslant 3\} \cup \{|z| \geqslant 14\})$, and equal to $-10/11$ on V. Hence also $\omega_2^*((z, w), K, \Omega) \geqslant \omega_2((z, w), K, \Omega) \geqslant -10/11$ on V. Choosing $\varepsilon < 1/10$ completes the proof. $\square$
