Socio-Economic Imaginaries and European Private Law

MARIJA BARTL

I Introduction

The aim of this chapter is to explore how our ideas about the economy and the market shape the way we think about the law, as well as how ideas about the law condition our understanding of what market is and what it ‘needs’. There are several reasons why we should explore this broad question through the prism of private law. One reason will be obvious to private lawyers: while sociologist have always underlined the immense importance of private law, and particularly contract law, for the institution of markets, private law scholarship and practice has been often understood as being insulated from political considerations, and presumably concerned mainly with corrective justice based upon rules logically deduced from first-order principles of personal freedom and the ‘will theory’. But how far can these discourses actually be isolated? Secondly, and perhaps more importantly, private law plays an important role in making and correcting markets and economies: the rule of law, understood as the enforcement of contracts and the protection of private property, has been portrayed as being core to economic development by financial and developmental institutions.

such as the World Bank or International Monetary Fund. The EU has, in contrast, attempted to constrain market forces through private law; for instance, by means of consumer law, which has become one of the core elements of its more ‘Social’ face. Ultimately, then, the question that this chapter raises is one of what we are actually saying when we say that we use the law, and private law in particular, as means to correct markets: What is our underlying conception of either the market or the law?

The argument that I would like to advance in this chapter is that legal and economic discourses, independently of whatever their participants would like to assume, share a set of fundamental pre-understandings as the relation between the subject of the legal-political order and the social whole – which has, in this way, co-instituted a particular kind of society in different historical periods. These shared pre-understandings ensure that the law and legal discourse tend to support, rather than subvert, the tenets (if not particulars) of socio-economic organisation. However, by uncovering this entanglement, we unearth a potentially subversive role for the law. To the extent that the law and legal discourse unsettle the shared pre-understandings as to the relation between the subject and the social whole, and offer alternative imaginaries as to the role of the law in society, a broader change in social imaginary may ensue.

To develop this argument, this chapter relies on the concept of social imaginaries, that is to say, ‘the ways people imagine their social

---

3 The stress on the enforcement of contracts and protection of property as the main component of the rule of law was particularly strong in the early 1990s; today, the hierarchy remains: ‘Rule of law captures perceptions of the extent to which agents have confidence in and abide by the rules of society, and in particular the quality of contract enforcement, property rights, the police, and the courts, as well as the likelihood of crime and violence.’ See http://info.worldbank.org/governance/wgi/pdf/rl.pdf.

existence, how they fit together with others, how things go on between them and their fellows, the expectations that are normally met, and the deeper normative notions and images that underlie these expectations. In the first part of the chapter, I develop a theoretical account, arguing that different economic, political and legal discourses converge around shared, and historically determined, pre-understandings (social imaginaries) as to what constitutes the socio-economic whole, who can act on it and how.

I further elaborate this argument by exploring the transformations of private law as a response to different imaginaries of the economy, politics and society in the last two centuries. I present three basic socio-economic imaginaries (the birth of the political economy; the market as a political project; and, finally, the market as a means of rationalisation), and show the ways in which these imaginaries have analogues in supportive legal imaginaries, rules and practices – even if legal discourse may have been blind to its very dependence upon wider social imaginaries.

In the second part of the chapter, I turn to European private, and, in particular, consumer, law in order to demonstrate how a new socio-economic imaginary enters and settles in European consumer law and policy. Taking as a starting point the European Commission’s communications on consumer policy, I illustrate how, over the last thirty years, different imaginaries of the market and the economy have shaped the horizons in EU consumer law. Finally, in the third and last part of the chapter, I illustrate some of the important impacts of the new economic imaginary on European private and consumer law. These include both the understanding of the subject of European Private Law (EPL) as well as the relation of the subject to the social whole.

When it comes to the limitations of the argument, there are several. First, the articulation of three socio-economic imaginaries against the background of the transformation of private law should not be seen as an exercise in historical reconstruction, but rather as an analytical framework that allows us to theorise the relation between the law and the economy in the context of EPL. Second, the historical references are based mainly upon secondary literature. For periodisation, I rely on several important contributions, including those of Duncan Kennedy.

---

and Christoph Schmid. Third, ‘the focus’ of the chapter is on the question of how stability is maintained over time, whereby the first part of the chapter articulates how the dominant imaginaries have been institutionalised in the rules of private law. A different story needs to be told about how social change is wrought: while a prelude to this topic may be found in the second part of the chapter, which discusses the penetration of the new economic imaginary in consumer law policy, social change and the law is the topic of a different and more ambitious project. The last limitation is geographical: given that the focus of the chapter is on EPL, I do not deal with the broader global history of economic or legal thought, but mainly focus the West European debate in the last 200 years.

II Social Imaginaries: The Bridge between Law and the Economy

Social imaginaries are collectively held, and are often the institutionalised, beliefs, ideas, images and fantasies that underwrite our lived experience. They represent shared pre-understandings as to what constitutes our social existence – how the economy, society, human relations, nature and politics fit together – thereby providing a basic infrastructure for meaning making, the reduction of complexity, and the ordering of social reality. Social imaginaries are historical creatures, ‘creating for each historical period its singular ways of living, seeing and making its own existence’, with its own temporalities, geographies and knowledge.

If social imaginaries present a shared basis for making sense of our social existence, they must also include imaginaries of the economy,

---

11 The reason I resort to the concept of imaginaries is at least twofold. First, having its origin in psychoanalysis, the concept builds on the recognition of the fragility of the shared, taking seriously the constitutive role of the individual imagination and leaving more space for fantasies and inconsistencies. At the same time, it is still apt to aid in the understanding as to why certain changes may be more fundamental than others: why some lead to a new society, while the others leave us in the old world (Sum and Jessop, Towards a Cultural Political Economy, n. 6 above.)

12 For Charles Taylor, modern social imaginary stands on three pillars – the distinction between public and private spheres, the economy as a distinct sphere, and finally the idea of collective self-determination. Taylor, Modern Social Imaginaries, n. 6 above.

13 Sum and Jessop, Towards a Cultural Political Economy, n. 6 above.

14 Castoriadis, The Imaginary Institution of Society, n. 6 above.
politics or law, and how they work together in the constitution of our social world. More specifically, I will argue that, because economic, political and legal imaginaries find their common foundation in deeper social imaginaries, they will share similar pre-understandings, at least at two different levels. First, they will share pre-understandings as to the nature of the social world, and the degree to which this world is transformable. Economic, political and legal imaginaries jointly institute the imagined boundary between the social and natural, the constructed and the given, the transformable and fixed. Second, economic, political and legal imaginaries will share similar pre-understanding as to agency in the socio-economic processes, and in particular how subjects/actors/collectivities/groups can intervene in the socio-economic process in order to change the social whole.

An example of a successful social imaginary that has set the ground for the transformation of the economy, politics and law is what is often referred to as neoliberal political rationality. Neoliberal imaginary has both grounded the understanding as to the appropriate social whole on which to intervene and how to do so. First, in this imaginary, the social whole is mostly seen as being synonymous with the market (be it global, international or national). Second, the mode of intervention on this social whole is not only to optimise the functioning of existing markets, but, more importantly, to spread its rationalising principles to other spheres where they were absent. Finally, in this imaginary, subjects and social actors (consumers, workers, employers, trade unions, etc.) have a common interest to work together in order to improve market functioning, achieve rationalisation of social processes, and improve international competitiveness.

This social imaginary has been articulated institutionalised, through various disciplinary discourses and practices. As I show in later parts of this chapter – which refer to legal discourse and practice – it has found its expression in a certain understanding of the law’s appropriate role. That is, on the one hand, understanding law as means to facilitate and harness markets and, on the other, a particular way in which legal subjects have been articulated. It was the actors who were expected to contribute to market dynamism that were assigned specific rights, duties, responsibilities and capacities to deliver on this goal. This is, of course, not to say that there have been no legal interventions in the EU that do not adopt

a more ‘interventionist’ stance, such as the general data protection regulation (GDPR), but such interventions have remained few, and unless sufficiently institutionalised, their ‘survival’ has often been under attack.16

In what remains of the section, I articulate different transformations of private law in response to different imaginaries of the economy, politics and society during the past two centuries. I will show how three different economic imaginaries have their counterparts in supportive legal imaginaries, rules and practices.

II.1 The Birth of Political Economy and Classical Legal Thought

One of the tectonic shifts that consolidated in the eighteenth century was the discovery of political economy.17 The economy became visible as a sphere governed by a set of interdependent natural-like processes, when the ‘naturality’, with all its predictable law-like qualities, stemmed from modelling the social world as a series of interactions between predictable (i.e. rational self-interested) individuals.18 This political economy became both the object of, and the limitation to, governmental intervention: the question of the desirability of intervention depended for the most part on establishing the possibility of intervention: to wit, how far is the economy transformable through political and legal intervention?

Among classical economists, two main answers were given to this question: on the more optimistic side, Adam Smith furthered a positive case for the market.19 Even if he acknowledged that market processes may sometimes be disruptive, ultimately, this process was a natural means to progress. The natural human propensity to self-interest and barter becomes a common good in a self-regulated market.20 Others, like

17 In his seminar contribution, Foucault discusses the birth of political economy from Physiocrats; see Michel Foucault, Arnold I. Davidson (ed.) and Graham Burchell (trans.), The Birth of Biopolitics: Lectures at the Collège de France, 1978–1979 (Basingstoke: Palgrave Macmillan, 2008).

18 Ibid.

20 Ibid.
Ricardo, or Malthus, took a slightly more pessimistic attitude: while the market process may bring about much human suffering, especially for less fortunate peoples, there is little point in intervening to help them since any such intervention would be counter-productive.\textsuperscript{21} If one regulates wages, it will ultimately harm the poor because it will lower employment. If one limits hours of work, it will ultimately harm those who want to work more to ensure the livelihood of their extended families. If one prohibits usury, one will see the emergence of a black market. Intervention, in fact, makes things worse; the best we can do is to let the natural course of things run its course.

Both of these positions presuppose a self-regulated, given or non-transformable quality of the market economy: political intervention (through the law) would either impede progress or would be futile. Such naturalised views of the economy were further sustained by a broader shift to ‘positivism’ in social sciences, which viewed society more generally as operating upon the basis of scientific laws akin to gravity.\textsuperscript{22} This transformation has been accompanied by the development of specific technologies of observation and government, such as statistics, which enabled the observance of regularities in various populations, with regard to specific problems or times.\textsuperscript{23}

At least four symmetries between this economic thought and discourse, on the one hand, and private and particularly contract law, on the other, are observable during the ‘classical’ period. By observing these symmetries, then, we can infer the shared pre-understandings that make these two spheres – so to speak – work to maintain the existing social order – even if they may not be seen as linked.

First, the naturalism that spanned market thinking also spanned private law.\textsuperscript{24} If the naturalised imaginaries of the market hinged on the predictability of its operation, in so far as they could be scientifically deduced from a vision of the social order that hinges on the rational (and natural) behaviour of self-interested individuals, we can see a similar naturalising tendency reflected in the deductive character of private and

\textsuperscript{22} Auguste Comte, \textit{The Positive Philosophy of Auguste Comte V1} (Whitefish, Literary Licensing, 2014).

\textsuperscript{24} Gordley, \textit{The Philosophical Origins of Modern Contract Doctrine}, n. 2 above, p. 218.
contract law. Quite contrary to public law, private law could have been inferred rationally from the higher natural principles, such as individualism and free will, by scholars or experts, rather than through a political process. Upon the same basis, private law claimed universality, justified both by belief in the generality of such deductive ‘exercises’, as well as a naturalised understanding of the individual and (corrective) justice.

Second, both the market and private law imaginaries had a similar subject in mind. They both relied on a subject that is an autonomous, formally free individual, who must be ready to bear the consequences of their actions in the marketplace. Such individuals were expected to deliver public benefit(s) by looking after their own affairs (private vice, public virtue) – while they, instead of any public authority, are trusted to know their own interests best. In this sense, the safeguarding of individual liberty became important, as a matter of political theory, political economy, and law.

We may find the third parallel in the relation between the subject and the social whole, as framed in both political economy and private law. The political economy of the times was an order in which the innumerable interactions of individuals (micro level) gave rise to a certain natural, spontaneous (macro) order. Private law quite neatly resembles this picture. The idea of free, autonomous and responsible individuals, and their wills, were to engage in their individual dances within the institutions of property and contract law – thus creating an organic society bottom up, a variant of what ordoliberalists were later to call the ‘private law’ society.

Fourth, there is a common concern with dynamism in both political economy and private law. The emergence of political economy in the eighteenth century is closely linked to the formation of national markets, which enabled intensified interaction across the national territory. The same goes for early civil codes, such as the Code Civil des Français or

26 Atiyah, The Rise and Fall of Freedom of Contract, n. 2 above.
27 Duncan Kennedy, ‘Three Globalizations of Law and Legal Thought’, n. 9 above.
Napoleonic Code, which were intended as both a means of market making and nation making.\(^{31}\) The formalism and abstractness of contract law, then, not only parallels but also enables the pursuit of market dynamism.\(^{32}\) As subsequent critics of the process of ‘materialisation’ make clear, any de-formalisation of contract that considers the particulars of the transaction (as it concerns persons or goods) moves us out of the domain of ‘pure contract’.\(^{33}\)

The underlying conception of politics behind both the economic and the legal imaginaries in this period is that of *futility*. The naturalised conceptions of the market require as little political intervention as possible, while the logical rules of private law are not open to politics at all. What typifies the imaginaries of this time is thus a shared pre-understanding of how social change takes place. While both economic thought and private law focus on the micro-level social structure – to wit, the individual – be it as a pursuer of self-interest or as the formally equal subject of private law, social change is imagined as an organic bottom-up process, driven by both capable individuals and market-driven technological change. The role for politics – or the law – for social change is limited at best.

**II.2 The Market as a Political Project: The Rise of the Social in Legal Thought**

In the last quarter of nineteenth century, there arose an increasing political and legal confidence in Europe that the state should interfere in the operation of the ‘free markets’.\(^{34}\) While some early interventions had already taken place in the nineteenth century,\(^{35}\) the emergence of unionisation and the labour movement as agents of social change greatly intensified the degree of intervention. Even though the history of labour movements across Europe differs,\(^{36}\) it can quite safely be concluded that the strengthening of the labour movement was one of the major forces

that drove the expansion of the franchise and the subsequent ‘social-democratisation’ of politics in Western Europe.37

Keynesian macroeconomics,38 which, in a very important way, denaturalises markets, has perhaps been one of the most obvious embodiments of the new social imaginary. Change was the socio-economic project of the time. In this imaginary, ‘we’ know how the economy operates and how to intervene in it: thus, political and legal intervention could be employed in order to ensure full employment and better distribution of economic benefits.39 The reimagining of the market was also accompanied by a shift in political discourse. The concerns with justice, equality, or substantive freedom became increasingly important: be it in response to the threat of communism, or a genuine care for social justice, the market outcomes appeared increasingly to be at odds with the liberal principles of freedom or equality.40 On the side of economic thought, marginalism, and the discovery of ‘marginal utility’, made it clear that the large inequalities of income and wealth were possibly not only morally wrong, but also economically unproductive.41

The imaginary of private, and contract law also fundamentally changes. Private law is increasingly seen as both the infrastructure of market economy, which sets the ground rules for the struggle among different groups and interests, as well as an institution which is distributive in its own right.42 By the same token, scholars came to believe that changing the legal infrastructure led inexorably to changes in the economic outcomes.43 The most visible consequence of the denaturalisation of private law was the contraction of contract law. An ever-greater number of fields and institutions were carved out of contract law, including labour law, social law, tenancy protection and consumer protection, all of which constituted separate legal sub-disciplines with different

37 Ibid.

43 Ibid.
values and ideologies.\footnote{Ruth Dukes, \textit{The Labour Constitution: The Enduring Idea of Labour Law} (Oxford Monographs on Labour Law, 2014); Schmid, \textit{Die Instrumentalisierung Des Privatrechts Durch Die Europäische Union}, n. 10 above.} This process of ‘neo-feudalisation’ of contract law, which introduced groups back into the heart of private ordering, was accompanied by the processes of ‘materialisation’ of private law.\footnote{Weber, \textit{Economy and Society}, n. 1 above.} That is to say, to the extent that contract law was still concerned with the individual, it was no longer the abstract, formally free and equal person, but rather a socially situated individual with attendant factual or material inequalities.\footnote{Ibid. See, also, Friedrich Kessler, ‘Contracts of Adhesion – Some Thoughts about Freedom of Contract’ (1943) \textit{43 Columbia Law Review}, 629–42.} In both economic thought and policy, as well as private law, the socio-economic imaginary of this period comes with an important recognition of the existence of different social groups (be it that of workers, tenants, consumers or employers) and their differing interests. This represented an essential move beyond the individual of the classical period, whereby the social political and legal intervention were focused at the meso level of groups and collectivities.

The political imaginary of the time draws on the idea that politics is both a struggle and a compromise among groups with different interests. The ensuing legislative intervention into private law then aims to deliver a more balanced infrastructure for both political and economic exchange. Ultimately, this social imaginary stands on the shared pre-understanding that social change is possible through collective action and law, including private law. The main agents of change are groups, rather than individuals.

\section*{II.3 Markets as a Means of Rationalisation: Facilitative Law}

The critique of the post-WW2 welfare state, built on the imaginary of the social, came from both the left and the right.\footnote{David Harvey, \textit{A Brief History of Neoliberalism} (Oxford: Oxford University Press, 2005).} The New Left criticised a bloated welfare state and bureaucracy, with its disempowering, colonising effects on ‘lifeworld(s)’.\footnote{Jürgen Habermas, \textit{Communication and the Evolution of Society} (Boston MA: Beacon Press, 1979), pp. 178–206.} The New Right presented the state as an intrusive, authoritarian institution, constraining market forces with economically negative consequences.\footnote{Harvey, \textit{A Brief History of Neoliberalism}, n. 47 above.} The economic stagnation of the end
of the 1970s gave some credence to the arguments of the latter group, signposting what we may call the neoliberal revolution.50

When it comes to the imaginary of the market economy, in the 1980s one perceives a certain move towards the renaturalisation of the market, with the narrative of ‘free market’ and ‘shock therapy’ as a signpost. This return to liberalism, in its neoliberal variant, came, however, with some important novelties.51 Above and beyond the free market, as a ‘private sphere’ that should be left free of governmental regulation, neoliberalism was also a broader critique of state institutions. In this imaginary, ‘more market’ was presented as a means of rationalisation of state institutions (government failure) and the economy.52 The idea is that the introduction of competition and market incentives will rationalise (make more efficient, cost sensitive) both public institutions (new public management) and the private sphere (touching everything from privatising industries to the flexibilisation of labour).53

This double imaginary of the market ensured that, despite the failures of Shock Therapy and of the Washington Consensus in the 1990s, a powerful neoliberal project remained intact.54 Perhaps markets left on their own do not really work, and some level of regulation may be necessary. Yet, viewing the market as a model for shaping social relations in order to achieve increased efficiencies across the social world, is a separate political project – and one broadly endorsed by politicians across the political spectrum from circa the second half of the 1990s.55

This new imagery of the market leads to new transformations of private law. If the perspective of private law was a micro perspective in the ‘classical’ period, focused on individuals, or ‘meso’ in the period of the focused on groups, from the end 1990s law and private law turns finally to the macro perspective of facilitating the market: private law becomes one of the instruments which contributes to the well-functioning market.56 In such

50 Ibid.
51 Ibid.
53 Harvey, A Brief History of Neoliberalism, n. 47 above.
54 Ibid.
a framework, labour law, for instance, turns into the law of the labour market.\(^{57}\) The main question behind labour law is no longer about the struggle between labour and capital, or employment relations between strong employer and weaker employee. Instead, the question becomes ‘what kind of normative or regulatory framework is needed in order for labour markets to function in the interests of a range of societal goals, of which efficiency is one’.\(^{58}\) The same move to the macro perspective of the market has also been observed in consumer law, mainly dominated by the EU. Thus according to Hans Micklitz, ‘consumer protection law’ has been turned by the EU into ‘consumer law’, which is more concerned with market functioning than consumer rights and protection.\(^{59}\)

An important consequence of adopting the macro perspective of the market is that it comes with an implicit perception of shared interest among various groups and classes which come to constitute the (internal) market. The discourses of competitiveness, flexibility, empowerment, dynamism and progress all aim at the better utilisation of all of society’s resources – ultimately to the benefit of all. The conception of the subject in private law changes as well. Markets, ever more defined in regional or global terms, need flexible and dynamic workers, who enjoy learning and moving around. The task of labour law, with its discourses of flexibility and learning, thus becomes a tool to support these human virtues.\(^{60}\) Equally, consumer law, in order to serve its (internal) market-building role well, must aim to produce rational and circumspect consumers, who are able to shop cross-border, and contribute to better (internal) market functioning.\(^{61}\)

Even if the civil law codifications of the nineteenth century (and their later cousins), which are in force across Europe, may present a certain resistance to this market-making instrumentalism in private law,\(^{62}\) there is significant disagreement as to their relevance in the face of the ‘penumbra’ of contract law developing in liberalised public services, or through

---

58 Ibid., p. 103.
60 Dukes, *The Labour Constitution*, n. 44 above.
the horizontal effects of treaty freedoms or non-discrimination principles.63

Finally, even the justice discourse changes in this period. Fundamental to the ‘third way’ conception of social justice, according to Hugh Collins, is the abandonment of the goal of relative equality among citizens, the equality of distributive outcomes.64 Instead, the concern became social inclusion, that is, ‘securing a minimum level of welfare’ for each citizen, with a particular focus on members of various disadvantaged groups, so that they may all reach the necessary minimum to participate in social life.65

The political imaginary of the time draws on is the politics of common interest. All individuals and groups – worker, consumers, university teachers, etc. – need an economy that is competitive and well functioning. The compromises are, however, no longer the outcomes of struggle, in either economic policy or private law, but rather the outcome of rational economic assessment of what improves (Kaldor-Hicks) market efficiency. Ultimately, this social imaginary stands on the shared pre-understanding that change comes when the entire economy performs well, rationalised at a national and regional level by introducing market principles across social institutions and, internationally, by improving its competitiveness vis-à-vis other global competitors. Notably, the recent attempts to spread deep free trade agreements (FTA), such as the TTIP, which is the FTA between the EU and the United States, can be seen as attempts to expand ‘market rationalising’ principles to global trade, making them more akin to national and regional modes of market regulation. However, the more recent discursive strengthening of mercantilism in international trade policy, which came with the current US administration (Trump), goes back to underscoring competition and quid-pro-quo.

III Socio-Economic Imaginaries in European Consumer Policy

If the previous section discussed the symmetries between economic thought and policy, on the one hand, and private law discourse and

65 Ibid., p. 22.
rules, on the other, establishing the shared pre-understandings of how the economy, the law, and politics coalesce, this section focuses on describing the transition from the imaginary of the market as a political project to the imaginary of the market as a means of rationalisation in the EU.

The proxy used is the communications on consumer policy of the European Commission from early 1980s. Behind these policies, of course, there will have been struggles between actors with differing agendas, both from within and from outside the European Commission, and these policies have been received differently by the disparate audiences to whom they were directed. However, what these documents dazzlingly expose is the language, and the underlying imaginary, that the EU Commission used in order to achieve broader political support for its policy objectives.

When considering the interactions between market imaginaries and private law imaginaries in the EU, one must account for one specifically EU complication. The first question is how did the shift in the representations of the market transform EU consumer law? The second is what specific role, if any, has been played by an EU-specific imaginary of the internal market? The latter requires a great deal of sensitivity due to the institutional and substantive constraints under which the EU operates, for they may have considerable implications for the way in which the EU constructs the idea of the market.

Indeed, EU consumer protection law has always been ‘the law of the internal market’, at least in name.66 Given the limited competences of the EU in the field of private law, European consumer legislation has been based upon the ‘internal market’ (now Article 114 TFEU) from its inception. However, what I try to show in what follows is that the entire ‘world’ may change while we still safely remain under the veil of internal market.

The first steps in consumer policy were taken from the 1970s. However, the first official Commission consumer Programme dates to 1981:

Community is primarily concerned with the need to enable the consumer to act with full knowledge of the facts, and to hold the balance between market forces. To do this, he must be able to exercise the five basic rights,

which the preliminary programme conferred on him. They are: the right to protection of health and safety; the right to protection of economic interests; the right of redress; the right to information and education; and the right of representation (the right to be heard).\(^{67}\)

While not quite as ambitious as later communications, the 1981 Programme still imagines private law in conflictual terms, a law of interest and struggle. Consumers are expected to safeguard their interests, and, to that effect, they are equipped with consumer rights. This image corresponds to the socio-economic imaginary of the social, where it is struggle, and conflict, that ‘balance’ market powers.

In the 1991 Commission Consumer Programme, the first after the Single European Act (1986), the Commission elaborates the link between the internal market and consumer policy:

In 1985 a programme was launched to give a new impetus to consumer policy. This coincided with the publication of the White Paper on the Internal Market and increased consciousness of the importance of addressing consumer concerns in the concentrated preparations for the Internal Market.\(^{68}\)

The Communication goes on to articulate how these rights (similar to those from 1981) will be delivered. First, when it comes to consumer representation, the Commission is interested in ensuring full representation of consumers in policy making, as well as providing support (including financing!) for the establishment of a strong consumer organisation, which could fight for consumers’ interests. Qua ‘consumer information’, the Commission aims to provide consumers with an ‘information service’, focusing on delivering information from various sources. Other matters that need to be taken care of are transparency, including addressing concerns about biotechnology, through labelling. Finally, the Commission aims to take action in Comparative Testing.

While, in this programme, the Commission draws a clear link between the internal market and consumer protection, the imaginary of the market, and the consumer interests and rights underpinning it, are still

understood in terms of conflict. The Commission goes even so far as to contemplate financing the emergence of strong consumer associations, which could fight for consumer interests effectively. In addition, the provision of information is still framed in terms of public obligations, including the provision of factual information coming ‘from various sources’ (e.g. ‘Sales promotion information is not of itself a sufficient basis for decision making for significant purchases’). Thus, while the Commission’s position may be underpinned by the ‘stakeholder’ understanding of democracy, it was less ‘managed’ in comparison with what was to come later. In other words, the conflictual nature of ‘common good’ is still beyond doubt.

The Consumer Agenda of 1998 was already moving towards a less conflictual representation of the market. Consumers, in the changing world (globalisation and IT), need to become aware of the ‘inter-linkages’ between their interests and the interests of other stakeholders:

A new influence for consumer policy that will have to be matched by a new maturity on the part of consumers and their representatives. If consumers are to play their role fully as equal stakeholders in society, they need to understand the inter-linkages between their interests and those of others . . . More specifically, as interests become more inter-linked, interactions need to be characterised by increased cooperation. Sometimes the respective interests of consumers and other groups will be mutually reinforcing, sometimes they will not and tradeoffs will have to be found. Consumers themselves can recognise and accept such trade-offs because they are not only consumers but taxpayers, employees and beneficiaries of public policies too. They can also accept that they have responsibilities and that their immediate interests as consumers have to be reconciled with longer-term concerns for the environment and society. EU consumer policy should therefore ensure that consumer interests are equitably reconciled with those of other stakeholders. This reconciliation of interests will usually be a positive-sum game.70

(my italics)

Now, what is striking about this document is a clear shift towards the macro perspective of the market, and the discourse of common interest. The

69 Interestingly, the focus on information duties as means to overcome ‘market failures’ have been present since the 1980s in the Consumer Credit Directive, which was administered by the DG Market, instead of DG Consumer Protection. Stefan Grundmann, ‘Information, Party Autonomy and Economic Agents in European Contract Law’ (2002) 39 Common Market Law Review, 269–93.
Commission makes consumers responsible for concerns that transcend their narrow group interests, and invites them to take seriously the interests of other stakeholders, including businesses, given that they are both taxpayers and employees. Moreover, this willingness to accept trade-offs is in the direct interest of consumers, in so far as such cooperation presents a positive-sum game. The market enlarges the size of the pie. This new mandated cooperative attitude to be expected from consumer representatives is particularly striking, given that many of these consumer representatives are financed by the EU.71 Last, but not least, it is in this consumer programme that we also see the birth of the famous concept of ‘consumer confidence’, which is to dominate subsequent EU interventions.72

Just three years later, the 2001 Green Paper constitutes an important shift in the rethinking of the (internal) market imaginary:

It is the cross-border movement of goods and services that allows consumers to search out bargains and innovative products and services and thus ensures that they optimise their consumption decisions. This cross-border demand increases competitive pressure within the internal market and allows for a more efficient and competitively priced supply of goods and services. This virtuous circle can only be achieved if the regulatory framework in place encourages consumers and businesses to engage in cross-border trade. Different national laws on commercial practices relating to business-consumer relations can hinder this evolution.73

(my italics)

In the 2001 Communication, two important things occur. First, the Commission proposes a distinct internal market imaginary, reinterpreting the diversity of private laws as a barrier to intra-community trade. Thus, the internal market becomes an important framework in its own right. Furthermore, the Commission introduces ‘costs and benefits’ language into the equation, when ‘cost-benefit’ analysis with its welfare economics background clearly points to a market perspective to resolve questions of consumer law.

The second crucial change is an explicit concern with subjectivities. Consumers should be encouraged to optimise their consumption

71 For one of the programmes, see: http://ec.europa.eu/chafea/consumers/funding/calls-for-tenders/tender-04–2018_en.htm.
decisions (become more cost rational) and thus improve overall market competitiveness in its cross-border dimension, and, consequently, benefit from better prices and better services. This is presented as the natural outcome of rational consumer behaviour in competitive markets. Most importantly, regulatory frameworks should encourage consumers to behave in such a way. Ultimately, this is for consumers’ benefit in so far as the ‘virtuous circle’ of competitiveness is in the common interest.

The more current air du temps is captured by the last Consumer Agenda 2012:

1. Consumer policy as an essential contribution to Europe 2020
   Consumer expenditure accounts for 56% of EU GDP and is essential to meeting the Europe 2020 objective of smart, inclusive and sustainable growth. Stimulating this demand can play a major role in bringing the EU out of the crisis. To make this possible, the potential of the Single Market must be realised. Data show that consumers shopping online across the EU have up to 16 times more products from which to choose, but 60% of consumers do not yet use this retail channel. As a result of this reluctance, they do not fully benefit from the variety of choice and price differences available in the Single Market. Improving consumer confidence in cross-border shopping online by taking appropriate policy action could provide a major boost to economic growth in Europe. Empowered and confident consumers can drive forward the European economy.74

The document views consumer law and policy as a market-making tool. Consumer law is clearly linked to the macro perspective of the market, and its purpose is to stimulate demand and bring about economic growth, which is clearly in the common interest. Consumers have a distinctive responsibility to contribute to this project and ‘drive forward the EU economy’, mainly through shopping online – the core internal market imaginary in recent years. ‘Protection’ plays a marginal role in this narrative: the language is about confidence and empowerment, which are directed towards market making, rather than with any concern for consumer protection. More recently, the Commission has even started using slogans such as ‘Justice for Growth’ in order to promote further initiatives of the DG Justice in the field of consumer protection.75

IV Socio-Economic Imaginaries and the Transformation of European Consumer Law

What are the hard law consequences of this shift in the underlying imaginary of the (internal) market for consumer protection in the EU? This an important question in so far as EU consumer policy was originally meant as a social policy – a way of getting closer to citizens – thus, the transformation in this arena tells a lot about the ways in which the ‘Social’ is envisaged in the EU. The questions that we will pursue below are that of who the new subject in European consumer law is, and how this subject should relate to the social whole? In other words, how much of the previous discussion actually translates into legal provisions? Given the limited space, I will pick up some of the most important critiques that have been mounted against EU consumer law in the last decades in order to illustrate what consumer lawyers find problematical.

IV.1 The Subject of European Consumer Law

A number of scholars have noted that the EU has considerably changed the concept of a ‘person’ in private law. The first critiques concerned the case law of the Court of Justice of the EU (CJEU), and its concept of the ‘average consumer’. This benchmark consumer, against whom the national law was tested, all too much resembled Adam Smith’s economic man, introducing a standard that struck down forms of protection targeted at the ‘not so up-to-standard’ consumers. Others critiqued the concept of the person in the EU more generally:

The combination of reducing persons to citizens, citizens to consumers, regarding the latter as instrumental to market building and moving towards horizontal and full harmonisation brings us very far away from contract law as a matter of justice.

77 Schmid, Die Instrumentalisierung des Privatrechts Durch die Europäische Union, n. 10 above.
In the 2000s, the new way of critique addresses the construction of internal market-useful subjectivities. As Micklitz has noted, 'with a weak consumer in need of protection, the internal market is not feasible. The Internal Market needs an active, informed and adroit consumer.' Consumer law targeted at this kind of consumer aims both to constitute a particular kind of subjectivity, and rationality, which puts those who do not fit into the desired model at various kinds of disadvantages. Not only do they have to pay for the forms of protection that they do not need, but also far less space and public funding is left for those activities from which they may profit.

IV.1.a Dealing with Those Not up to Speed

If weak consumers are not the main target of the protection, what happens to those who fall below the ‘standard’? The response to this question is particularly urgent because the liberalisation and privatisation of former public services makes these crucial services a subject of contract and consumer law. To deal with weak consumers, the EU introduced the concept of the ‘vulnerable consumer’, some time in the mid-2000s. The concept can be found in ‘regulated markets’ (‘In this context, each Member State shall define the concept of vulnerable customers which may refer to energy poverty’), but it is also penetrating more general consumer law (the Unfair Consumer Practices Directive: ‘consumers particularly vulnerable to the practice or the underlying product because of their mental or physical infirmity, age or credulity’).

Many authors have invested hopes in this concept as means to ensure a more socially minded consumer law, in particular, if linked to the concept of ‘affordability’. Yet, this confidence may be somewhat premature, for three reasons. First, while the term features in various policy

81 Bartl, ‘Internal Market Rationality, Private Law and the Direction of the Union: Resuscitating the Market as the Object of the Political’, n. 56 above.
84 Ibid., Article 5.3.
documents, it finds very little bite in practice. For instance, the third energy package, one of the most important venues in which the concept can be found, defines the obligations of Member States towards vulnerable consumers as follows: define the concept of a vulnerable consumer, prohibit the disconnections of vulnerable consumers in critical times, ensure the transparency of contractual terms, ensure that an independent dispute settlement mechanism is put in place, and ensure a single point of contact for any problems that consumers might face.86 Yet, if targeted at vulnerable consumers in particular, these do not seem particularly well suited. The only substantive obligation towards vulnerable consumers is the prohibition of disconnection in critical times (itself an inspiration taken from the United Kingdom). As for the rest, providing formal rights of access, the transparency of contract terms, contact points and dispute settlement mechanisms are all measures that are less than ideal (as the Commission itself notes) for addressing the needs of vulnerable consumers.87

Second, to the extent that the concept of affordability should play a role, it comes with few actual enforceable claims, rights or remedies for consumers. Instead, the Member States are only encouraged to rely on social protection systems or energy efficiency improvements in providing protection.88 Measures that are potentially more effective for ensuring the ‘affordability’ of energy supply that go further than just ‘competitive price’ – such as ‘social tariffs’ or ‘default tariffs’ – are actively discouraged.89

IV.2 The Relation of the Subject to the Social Whole

IV.2.a Focus on Information

In European Consumer Law, very few developments mark the shift to a different socio-economic imaginary in the same way as the increased focus on ‘information provision’.90 While, in the first decades of EU policy, consumers were meant to receive information from public sources, in order to be equipped to engage with other market actors,91
the later approach turns towards the provision of information by the providers of goods or services themselves.

The shift towards the provision of information as a core instrument in EU consumer policy was justified by the double service that it may perform: the provision of information empowers consumers, making them aware of what kind of goods or services they are purchasing. At the same time, reducing information asymmetries between consumers and sellers is an important way of improving market functioning.

The enthusiasm for this governance tool still holds strong in the EU policy, despite criticism. Quite illustratively, if the last Consumer Agenda consists of sixteen pages, the policy paper ‘Knowledge Enhancing Aspects of Consumer Empowerment’ runs to thirty-two pages. But even in the Consumer Agenda itself, the information duties receive considerably more space than, for instance, ‘vulnerable consumers’ do.

In terms of distributional effects, this is a rather questionable choice. As a matter of general consumer policy, the information provision does a poor job in either cleaning the markets or empowering consumers. A considerable amount of scholarship in behavioural psychology and behavioural economics demonstrates this point – an issue that the Commission itself acknowledges in the ‘Knowledge Enhancing’ policy document. What is more, however, the focus on information duties is a policy with sharply negative redistributive consequences. Those less well-off consumers are going to be disproportionally less able to make use of these mechanisms.

IV.2.b Concerns for Access Take Prominence

Another important shift that we can observe with the move towards the new socio-economic imaginary is the increased concern with access to markets, which takes precedence over other concerns, such as social...
justice or affordability. Access has gained prominence with the liberalisation and privatisation of formerly public utility sectors, such as telecoms, gas, electricity, postal services, and public transport, in so far as the state can no longer guarantee access. A similar concern with access also underpins the horizontal dimension of the principle of non-discrimination – namely, ensuring a non-discriminatory access across the sale of goods, provision of services, or labour market.

An increased interest in access merges two distinct normative concerns – while, in principle, it is concerned with ‘not leaving anyone behind’, the concern with access is also able to contribute to the internal market commitments by increasing market dynamism. Ideally, all consumers should be ‘confident consumers’ reaping the benefits of the internal market, with part of the mobile workforce moving flexibly to where market needs lie, or learning the skills that the market requires.

What makes the concern with access resonate with the new socio-economic imaginary is that both access and access to justice are essentially procedural devices, which endorse a ‘hands off’ approach from the market itself, which is particularly handy within the context of the EU. As Somek observes, ‘what matters is that nobody is barred from availing oneself of an opportunity while it is taken for granted that the existence of the opportunity itself does not raise any questions of justice’.

Several distributional consequences stem from this concern. To the extent that it becomes a substitute for the welfare state, and thus could be seen as being able to substitute or override some of its redistributive policy instruments, it may present a threat to any ‘solidaristic’ understanding of private law in the EU. Equally, the concern with access may

In labour law, the question of inclusion/exclusion was one of the main justifications (also from the Left) to justify the lowering of labour protections for those with, for instance, permanent contracts.
103 Somek, n. 102 above.
yield regressive outcomes if we take into account the possible cross-
subsidisation of its relatively sophisticated beneficiaries by the less well-
off consumers.104

V Conclusion: Rationalisation and Common Interest

Early neoliberal discourse has, in many different ways, renaturalised
markets: some of the most egregious examples of such thinking were
the Washington Consensus, on the one hand,105 and Shock Therapy, on
the other.106 Yet, while the idea that markets are self-regulating entities
has become discredited, from the 1990s onwards, there has been
a growing consensus across the political spectrum as to the epistemic-
normative case for the market.107 The market came to be seen as a means
of rationalisation of social life: improving the allocation of scarce
resources by introducing competition and incentives across private and
public institutions.

This representation of the market as a means of rationalisation has had
several important consequences in private law. First, we have seen the
reinterpretation of fields such as labour law, or consumer protection, in
macro terms of the market. Such reimagining rests on the idea of
common interest: there is a limited need for the struggle between groups
(between labour and capital, or between producers and consumers), in so
far as they are all united in creating a virtuous circle of competitiveness
and economic growth, which would make the EU the most competitive
knowledge economy in the world.

Second, if market-incentives are seen as the best way of enhancing the
rationality of the allocation of scarce resources, interventions should be
supportive of market principles, rather than undermining them. We thus
see certain types of intervention gaining the upper hand in private law
(e.g. information duties, labelling, and various procedural rights), while
recourse to social security (tax) seems to be the choice in areas where the
provision of services is essential.

Third, in so far as markets need ‘participants’ in order to function, private law legislation will focus both on encouraging participation and access, as well as model laws on those who are market-useful. It is the flexible worker and confident consumer – rather than the weak consumer and the protected employee – who are the main addressees of legislation; weak consumers will have to be accommodated through special provisions on access or vulnerability. Both competent consumers and flexible workers also bear particular responsibilities, in so far as market regulation is dependent on their correct functioning.

Yet the responsibilities that these new subjects have are different to those of the autonomous or responsible individuals of the nineteenth century. Classical contract law’s subjects carried the responsibility for the contracts that they concluded. At the same time, their choices were epistemically prior to those of the public when it came to the choice of goals – they were the best judges of their own interest. Today, however, workers and consumers are not trusted to choose the right goals and preferences. Instead, they are increasingly made responsible for market making, through switching providers and changing jobs, ensuring competitiveness and dynamism.

Finally, what seems to be of major political significance is that private law, on the one hand, and the market, on the other, are progressively freed from conflict in the new socio-economic imaginary. The market is no longer a playground of genuine conflict between various groups, but is, instead, a space where one is struggling against (vulgarised) versions of ‘efficiency’ or part of a ‘managed’ conflict in the European Commission’s stakeholder democracy. To the extent that conflicts are still spoken of, for instance, in front of the courts, the struggles are often framed as a conflict between labour versus efficiency (Porto di Genova, Viking),\(^\text{108}\) or consumer protection versus the free circulation of goods, ultimately taking capital and material conflict out of the equation.
