9 **This PDF file includes:**

10 Legend for Movie S1

11 **Other supplementary materials for this manuscript include the following:**

12 Movie S1

13 **Movie S1. Boundary Texture Compression.**

14 Movie of the mechanical metamaterial upon manual actuation of the central unit cell. On top is the real image and in the bottom is the
15 image variance. The first video shows the metamaterial in the non-winding non-Hermitian topological phase, where the edge mode is localised
16 on the right (non-reciprocal parameter $\varepsilon = 0.00$). The second movie shows the metamaterial in the winding non-Hermitian phase, where the
17 edge mode is localised on the left (non-reciprocal parameter $\varepsilon = 0.20$).
