Search for Heavy Higgs Bosons Decaying into Two Tau Leptons with the ATLAS Detector Using $pp$ Collisions at $\sqrt{s} = 13$ TeV

G. Aad et al.*

(ATLAS Collaboration)

(Received 28 February 2020; accepted 26 June 2020; published 27 July 2020)

A search for heavy neutral Higgs bosons is performed using the LHC Run 2 data, corresponding to an integrated luminosity of 139 fb$^{-1}$ of proton-proton collisions at $\sqrt{s} = 13$ TeV recorded with the ATLAS detector. The search for heavy resonances is performed over the mass range 0.2–2.5 TeV for the $\tau^+\tau^-$ decay with at least one $\tau$-lepton decaying into final states with hadrons. The data are in good agreement with the background prediction of the standard model. In the $M^2_{h}$ scenario of the minimal supersymmetric standard model, values of $\tan\beta > 8$ and $\tan\beta > 21$ are excluded at the 95% confidence level for neutral Higgs boson masses of 1.0 and 1.5 TeV, respectively, where $\tan\beta$ is the ratio of the vacuum expectation values of the two Higgs doublets.

DOI: 10.1103/PhysRevLett.125.051801

The ATLAS and CMS collaborations discovered in 2012 a new boson with a mass of 125 GeV [1,2]. Current measurements [3,4] indicate that the new particle is compatible with the Higgs boson predicted by the standard model (SM) [5–7]. This discovery opens the way for studies of the structure of the Higgs sector. Many theoretical models beyond the SM, such as two-Higgs-doublet models (2HDMs) [8], extend the Higgs sector to include a second Higgs doublet which implies the existence of new heavy pseudoscalar ($A$) and scalar ($H$) states, while the observed scalar particle would correspond to the lightest Higgs boson ($h$). The decay probability of these scalar states into $\tau^+\tau^-$ pairs can be enhanced relative to other decay modes in 2HDMs of type II, such as the minimal supersymmetric standard model (MSSM) [9,10], the minimal extension of the SM that realizes supersymmetry [11–16].

At tree level, the properties of the MSSM Higgs sector depend only on two non-SM parameters, which can be chosen to be the mass of the pseudoscalar Higgs boson, $m_A$, and the ratio of the vacuum expectation values of the two Higgs doublets, $\tan\beta$. Beyond tree level, the Higgs sector is affected by additional parameters, the choice of which defines various MSSM benchmark scenarios. In the $M^2_{h}$ scenario [17], the parameters are such that the mass of the lightest $CP$-even Higgs boson, $m_h$, is close to the measured mass of the Higgs boson discovered at the LHC [18] and the masses of all superparticles are heavy enough to only mildly affect the production and decays of the MSSM Higgs bosons. The couplings of the MSSM heavy Higgs bosons to down-type fermions are enhanced with respect to the SM for large $\tan\beta$ values, resulting in increased branching fractions to $\tau$ lepton and $b$ quarks, as well as a higher cross section for Higgs boson production in association with $b$ quarks ($bbH$). For the mass range considered in this Letter, the mass difference between the $A$ and $H$ bosons is much smaller than the experimental resolution and they are treated as degenerate in mass.

This Letter describes a search for massive scalar and pseudoscalar resonances decaying into a $\tau$-lepton pair (throughout this Letter the inclusion of charge-conjugate decay modes is implied). The search is conducted on a sample of proton-proton collision data with an integrated luminosity of 139 fb$^{-1}$ at a center-of-mass energy of $\sqrt{s} = 13$ TeV, collected with the ATLAS detector [19–21] during the Run 2 of the LHC (2015–2018) [22]. The $r_{\tau\text{lep}}$ and $r_{\tau\text{had}}$ decay channels are considered, where $r_{\tau\text{lep}}$ denotes the decay of the $\tau$ lepton into neutrinos and an electron ($\tau_e$) or into neutrinos and a muon ($\tau_\mu$) and $r_{\tau\text{had}}$ denotes the decay into a neutrino and hadrons. This search improves on the results obtained by previous searches performed by the ATLAS and CMS collaborations at a center-of-mass energy of $\sqrt{s} = 13$ TeV [23–25] by about a factor of 4–5 for a scalar boson in the mass range 700–2500 GeV, thanks to improvements of the modeling of the top-quark background and of the backgrounds estimated from data, of the reconstruction of high-$p_T$ $\tau$ leptons and the increase of integrated luminosity.

The ATLAS detector at the LHC covers nearly the entire solid angle around the collision point [26]. It consists of an inner tracking detector surrounded by a thin superconducting solenoid, electromagnetic and hadronic calorimeters,
and a muon spectrometer incorporating three large superconducting toroidal magnets.

Samples of Monte Carlo (MC) simulated events are used to optimize the event selection, estimate the signal efficiencies, and model some of the background processes. The generators and parton showers used to simulate the different MC processes are summarized in Table I. The production cross sections and branching fractions for the various MSSM scenarios are calculated using procedures described in Refs. [27,28]. The cross sections for gluon-gluon fusion (ggF) production calculated with SUSHI [29,30] include next-to-leading-order (NLO) supersymmetric-QCD corrections [31–36], next-to-next-to-leading-order (NNLO) QCD corrections for the top quark [37–41], and light-quark electroweak effects [42,43]. The $bbH$ cross sections are calculated in the five-flavor [44] and four-flavor schemes [45,46], and the predictions are combined as described in Refs. [47–50]. The other production modes contribute negligibly in the $M_H^{125}$ scenario and are not considered. The masses and mixing (and effective Yukawa couplings) of the Higgs bosons are computed with FeynHiggs [51–58]. Branching fractions of Higgs bosons are computed using a combination of results calculated by FeynHiggs, HDECAY [59,60], and PROPHETCY4F [61,62], following the procedure discussed in Ref. [27]. The samples were produced with the ATLAS simulation infrastructure [63] using the full detector simulation performed by the geant4 [64] toolkit, with the exception of $bbH$ production of the MSSM Higgs boson signal, for which the ATLFASTII [63] fast simulation framework was used.

In this search, the leptonic $\tau$ decays are identified by their charged decay product, either an electron or a muon. Electron candidates are reconstructed from energy deposits in the electromagnetic calorimeter associated with a charged-particle track measured in the inner detector [93]. They are required to have $|\eta| < 2.47$. The transition region between the barrel and end cap calorimeters ($1.37 < |\eta| < 1.52$) is excluded.

Muon candidates are reconstructed in the range $|\eta| < 2.5$ by matching tracks found in the muon spectrometer to tracks found in the inner detector [94]. The selected leptons in the $\tau_{lep}\tau_{had}$ channel are required to have a transverse momentum $p_T > 30$ GeV, pass the “medium” quality requirement for both the electrons [93] and muons [94] and satisfy a $p_T$- and $\eta$-dependent isolation criterion called “Gradient”, which uses calorimetric and tracking information. The efficiencies for the identification and isolation criteria are given in Refs. [93,94].

Jets are reconstructed from topological clusters [95] of energy depositions in the calorimeter using the anti-$k_t$ algorithm [96], with a radius parameter value $R = 0.4$ [97]. The average energy contribution from pileup is subtracted according to the jet area and the jets are calibrated as described in Ref. [98]. Jets are required to have $p_T > 20$ GeV and $|\eta| < 2.5$. The effect of pileup is reduced by using tracking information associated with the calorimeter-based jets to reject those not originating from the primary vertex [99]. The primary vertex is chosen as the proton-proton vertex candidate with the highest sum of the squared transverse momenta of the associated tracks.

In order to identify jets containing $b$ hadrons ($b$ jets), a multivariate algorithm (MV2) is used [100]. The algorithm has an average efficiency of 70% for $b$ jets and rejections of approximately 9, 36, and 300 for $c$ jets, $\tau$ decays with hadrons, and jets initiated by light quarks or gluons, respectively, as determined in simulated $t\bar{t}$ events. Correction factors are applied to the simulated event samples to compensate for differences between data and simulation in the $b$-tagging efficiencies for $b$ jets, $c$ jets and light-flavor jets.

Hadronic $\tau$ decays are composed of a neutrino and a set of visible decay products ($\tau_{had-vis}$), typically one or three charged pions and up to two neutral pions. The $\tau_{had-vis}$ candidates reconstructed from seeding jets [101] must have $p_T > 25$ (65) GeV in the $\tau_{lep}\tau_{had}$ ($\tau_{had}\tau_{had}$) channel, $|\eta| < 2.5$ excluding $1.37 < |\eta| < 1.52$, one or three associated tracks and an electric charge of $\pm 1$. A boosted-decision-tree identification procedure, based on calorimetric shower shapes and tracking information, is used to reject jets.

The $\tau_{had-vis}$ candidates must satisfy “loose” or “medium” $\tau$ identification criteria [101] with efficiencies of about 85% (75%) and 75% (60%) for one-track (three-track) $\tau_{had-vis}$ candidates, respectively. The rejections factors of “loose” and “medium” $\tau$ identification in multijet events are about

The missing transverse momentum, $E_T^{\text{miss}}$, is calculated as the negative vectorial sum of the $p_T$ of all fully reconstructed and calibrated physics objects [102]. In addition, this procedure includes a soft term, which is calculated using the inner-detector tracks that originate from the hard-scattering vertex but are not associated with reconstructed objects.

Events in the $\tau_{\text{lep}}\tau_{\text{had}}$ channel are selected using single-electron and single-muon triggers with $p_T$ thresholds ranging from 20 to 26 GeV and various isolation criteria [103,104]. The events must contain at least one $\tau_{\text{had-vis}}$ candidate passing the medium identification and exactly one isolated lepton ($\ell$). The $\tau_{\text{had-vis}}$ candidate must have $|\eta| < 2.3$ to reduce misidentified-electron background [105]. The isolated lepton and the $\tau_{\text{had-vis}}$ candidate must have opposite electric charge and be back to back in the transverse plane: $|\Delta\phi(p_T^\ell, E_T^{\text{miss}})| > 2.4$ rad. To reduce background from $W + \text{jets}$ production the transverse mass $m_T(p_T^\ell, E_T^{\text{miss}}) = \sqrt{2p_T^\ell E_T^{\text{miss}}[1 - \cos \Delta\phi(p_T^\ell, E_T^{\text{miss}})]}$, calculated with the lepton $p_T$ and the event $E_T^{\text{miss}}$, must be less than 40 GeV. To reduce background from $Z \rightarrow \ell\ell$ production in the $\tau_{\text{had}}$ channel, events in which the isolated lepton and the $\tau_{\text{had-vis}}$ candidate have an invariant mass between 80 and 110 GeV are rejected. The background contribution from $Z \rightarrow \mu\mu$ in the $\tau_{\text{had}}$ channel is found to be negligible. The signal acceptance times efficiency for each of the $\tau_\tau$ and $\tau_\mu$ channels varies between 2% and 7% for signals with masses of 0.2–2.5 TeV (the acceptance is calculated with respect to the sum of all $\tau$ decay modes; the efficiency is calculated taking into account detector acceptance, reconstruction and selection efficiencies).

Events in the $\tau_{\text{had}}$ channel are selected by single-$\tau$ triggers with $p_T$ thresholds of 80 GeV (5.4 fb$^{-1}$ from June 2015 to May 2016), 125 GeV (9.3 fb$^{-1}$ in May–June 2016) and 160 GeV (124 fb$^{-1}$ from June 2016 to October 2018). Events must contain at least two $\tau_{\text{had-vis}}$ candidates and no electrons or muons. The $p_T$ of the leading $\tau_{\text{had-vis}}$ candidate must exceed the trigger $p_T$ threshold by 5 GeV. The leading (subleading) $\tau_{\text{had-vis}}$ candidate must satisfy the medium (loose) identification criteria. The two $\tau_{\text{had-vis}}$ must have opposite electric charge and be back to back in the transverse plane: $|\Delta\phi(p_T^{\tau_1}_{\text{had-vis}}, p_T^{\tau_2}_{\text{had-vis}})| > 2.7$ rad. The signal acceptance times efficiency varies between 2% and 20% for signals with masses of 0.35–2.5 TeV, and it decreases rapidly for lower mass values due to the selection criteria imposed on the $p_T$ of the decay products of the $\tau$ leptons.

Events satisfying the selection criteria of either channel are divided into categories to exploit the different production modes in the MSSM: the $b$-tag category for events containing at least one $b$-jet and the $b$-veto category for events containing no $b$ jets. These categories are the signal regions used by the analysis.

The $\tau\tau$ mass reconstruction is crucial for good separation between signal and background events. However, its reconstruction is challenging due to the presence of neutrinos from the $\tau$-lepton decays. The mass reconstruction used for both channels is the total transverse mass, defined as $m_T^{\text{tot}} = \sqrt{(p_T^{\tau_1} + p_T^{\tau_2} + E_T^{\text{miss}})^2 - (p_T^{\ell} + p_T^j + E_T^{\text{miss}})^2}$ for either ($\ell^-$, $\tau_{\text{had-vis}}$) or ($\tau_{\text{had-vis}}^1$, $\tau_{\text{had-vis}}^2$) as $(\tau_1, \tau_2)$.

The dominant background contribution in the $\tau_{\text{lep}}\tau_{\text{had}}$ channel arises from processes where the $\tau_{\text{had-vis}}$ candidate originates from a jet. Such background events are divided into those where the selected lepton is correctly identified, mainly from $W + \text{jets}$ ($W\ell$) production in the $b$-veto ($b$-tag) category, and those where the selected lepton arises from a jet, mainly from multijet production. These contributions are estimated using a data-driven technique, which is similar to that described in Ref. [24]. Three orthogonal control regions are defined using the same selection as for the signal region, except that the lepton candidate fails isolation requirements in CR-0, the $\tau_{\text{had-vis}}$ candidate fails $\tau$ identification in CR-1, and both fail these conditions in CR-2. The multijet background events are estimated from CR-0 weighted with lepton correction factors, called fake factors, which are ratios of the numbers of lepton candidates passing and failing the isolation requirements [24] (hereafter, fake factors refer to ratios of the number of candidates passing a certain identification requirement to the number of candidates failing the requirement). The $W + \text{jets}$ ($W\ell$) background events are estimated from CR-1 after subtracting the multijet background contributions estimated from CR-2 corrected with lepton fake factors. Real $\tau$-lepton contributions in CR-1 are subtracted using MC simulation. The $\tau$-lepton fake-factor weights measured in data are then applied to the events in CR-1 to estimate the $W + \text{jets}$ ($W\ell$) background in the signal region. Backgrounds where both the lepton and $\tau_{\text{had-vis}}$ candidates originate from electrons, muons or $\tau$ leptons arise from $Z/\gamma^* \rightarrow \tau\tau$ production in the $b$-veto category and $W$ production in the $b$-tag category.

with minor contributions from $Z/\gamma^* \to \ell \ell'$, diboson and single top-quark production. These contributions are estimated using MC simulation. To constrain the normalization of the $t\bar{t}$ contribution, a top-quark control region is included in $t\bar{t}$ events defined by substituting the transverse mass requirement with $m_T(p_T, E_T^{\text{miss}}) > 110$ (100) GeV in the $b$-tag category of the $\tau_{\tau} \gamma$ channel. This region is included in the fitting procedure. Other major background contributions can be adequately constrained in the signal regions.

The dominant background contribution in the $\tau_{\tau} \gamma$ channel is from multijet production, which is estimated using a data-driven technique described in Ref. [24]: the background is estimated from a control region whose events pass the same selection as for the signal region, except the subleading $\tau_{\tau} \gamma$ candidates fail $\tau$ identification. Then the events are weighted with fake factors measured in a region enriched with multijet events to obtain the multijet background estimation in the signal region. The other nonnegligible backgrounds contributions are $Z/\gamma^* \to \tau\tau$ production in the $b$-veto category, $t\bar{t}$ production in the $b$-tag category, and to a lesser extent $W(\to \nu\tau, \ell\nu)+$jets, single top-quark, diboson, and $Z/\gamma^* (\to \ell\ell')$ +jets production. These contributions are estimated using MC simulation. To improve the modeling of jets faking hadronic $\tau$ decays (fake $\tau$ leptons), events in the simulation that contain quark- or

FIG. 1. The $m_T^{\text{jet}}$ for the $b$-veto (left) and $b$-tag (right) categories of the $\tau_{\tau} \gamma$ channel (top) and $\tau_{\tau} \gamma$ channel (bottom). The binning displayed is that entering into the fit. The predictions and uncertainties for the background processes are obtained from the fit assuming the background-only hypothesis. Expectations from signal processes are superimposed. Overflows are included in the last bin of the distributions.
gluon-initiated jets that are misidentified as $\tau_{\text{had-vis}}$ candidates are corrected to follow rates of fake $\tau$ leptons measured in $W +$ jets and $t\bar{t}$ enhanced regions in data. Uncertainties affecting the simulated signal and background contributions are considered in the statistical analysis. These include uncertainties associated with the determination of the integrated luminosity [106,107], the detector simulation, the theoretical cross sections, and the background modeling. For MSSM Higgs boson samples, various sources of uncertainty which affect the signal acceptance are considered, such as the impact of varying the factorization and renormalization scales and uncertainties in the modeling of initial- and final-state radiation, as well as multiple parton interactions. The sensitivity of the search is limited by statistical uncertainties, especially for scalars with mass values above 600 GeV. The main systematic uncertainties are shown in Table II. They are related to the determination of the $\tau_{\text{had-vis}}$ identification efficiency and energy scale, estimation of the backgrounds with misidentified $\tau_{\text{had-vis}}$ and modeling of $Z +$ jets background. The uncertainty in the $\tau_{\text{had-vis}}$ identification efficiency is determined from measurements of $Z \to \tau\tau$ events and, for the high $p_T$ regime, an additional uncertainty is assigned from the validation of the $\tau_{\text{had-vis}}$ properties in high-$p_T$ dijet events. The uncertainty in the $\tau_{\text{had-vis}}$ energy scale is derived from $Z \to \tau\tau$ events as well, and from single hadron test-beam data, and it is validated for high-$p_T \tau_{\text{had-vis}}$ with top-quark events and $Z(\rightarrow \tau\tau)$ events with large transverse momentum. Uncertainties in the determination of backgrounds with misidentified $\tau_{\text{had-vis}}$ include the uncertainty from the subtraction of other backgrounds in the control regions, the uncertainty from differences in the jet composition between control regions and signal regions. For $Z +$ jets production, cross-section and modeling uncertainties are taken from Refs. [108,109].

A simultaneous fit of the $m_{\phi}^d$ distributions of the top-quark control region and of the $b$-veto and $b$-tag categories of the $\tau_{\text{lep}}\tau_{\text{had}}$ and $\tau_{\text{had}}\tau_{\text{had}}$ channels is performed in the statistical analysis. The numbers of observed events in the $b$-veto and $b$-tag categories of the $\tau_{\text{lep}}\tau_{\text{had}}$ channel are 728 at 174 and 19 542, while event yields of 728 at 200 ± 3900 and 19 600 ± 400 for the background-only hypothesis are obtained from the statistical analysis, which includes the fit of the nuisance parameters associated with the systematic uncertainties.

For the $\tau_{\text{had}}\tau_{\text{had}}$ channel, the numbers of observed events in the $b$-veto and $b$-tag categories are 8420 and 381, and the fitted event yields from background processes are 8430 ± 150 and 368 ± 27. The $m_{\phi}^d$ distributions obtained from the fit performed simultaneously in the $b$-veto and $b$-tag categories of the two channels are shown in Fig. 1.

The data are found to be in good agreement with the obtained background yields, and the results are given in terms of exclusion limits. Upper limits on the cross section times branching fraction for a scalar boson (generically called $\phi$) decaying into $\tau$-lepton pairs are set at the 95% confidence level (C.L.) as a function of the boson mass. They are computed using a modified frequentist CLs method [110] with the profile likelihood ratio as the test statistic. The asymptotic approximation is used [111]. The upper limits cover the mass range 0.2–2.5 TeV and are shown for a production entirely via ggF in Fig. 2(a) and entirely via $b$-quark associated production in Fig. 2(b). The observed (expected) upper limits are 1.8 fb (3.8 fb) for ggF and 1.1 fb (2.2 fb) for $bbH$ production at $m_{\phi} = 1$ TeV. For
ggF, the lowest local $p_0$, the probability that the background can produce a fluctuation greater than the excess observed in data, is 0.014 (2.2σ) at $m_\phi = 400$ GeV, while for $b\bar{b}H$ production it is 0.003 (2.7σ) at $m_\phi = 400$ GeV. The natural width of the scalar boson is assumed to be negligible compared to the experimental resolution. Results are interpreted in terms of the MSSM in Fig. 2(c), which shows the regions in the $m_A - \tan \beta$ plane excluded at the 95% C.L. in the $M_h^{125}$ scenario. The observed (expected) upper limits exclude $\tan \beta > 21$ (24) for $m_A = 1.5$ TeV.

In conclusion, a search for heavy neutral Higgs bosons decaying into a pair of $\tau$ leptons is performed in the mass range 0.2–2.5 TeV using a data sample corresponding to an integrated luminosity of 139 fb$^{-1}$ from proton-proton collisions at $\sqrt{s} = 13$ TeV recorded by the ATLAS detector at the LHC. No significant excess over the expected SM backgrounds is found. Upper limits on the cross section for production it is 0.003 (24) for $m_A = 1.5$ TeV at the 95% C.L.

We thank CERN for the very successful operation of the LHC, as well as the support staff from our institutions without whom ATLAS could not be operated efficiently. We acknowledge the support of ANPCyT, Argentina; YerPhI, Armenia; ARC, Australia; BMWFW and FWF, Austria; ANAS, Azerbaijan; SSTC, Belarus; CNPq and FAPESP, Brazil; NSERC, NRC and CFI, Canada; CERN; CONICYT, Chile; CAS, MOST and NSFC, China; COLCIENCIAS, Colombia; MSMT CR, MPO CR and VSC CR, Czech Republic; DNDGF (Denmark, Norway, Sweden), CC-IN2P3 (France), KIT/GridKA (Germany), INFN-CNAF (Italy), NL-T1 (Netherlands), PIC (Spain), ASGC (Taiwan), RAL (UK), and BNL (USA), the Tier-2 facilities worldwide and large non-WLCG resource providers. Major contributors of computing resources are listed in Ref. [11].

[26] ATLAS uses a right-handed coordinate system with its origin at the nominal interaction point (IP) in the center of the detector and the $z$ axis along the beam pipe. The $x$ axis points from the IP to the center of the LHC ring, and the $y$ axis points upward. Cylindrical coordinates $(r, \phi)$ are used in the transverse plane, $\phi$ being the azimuthal angle around the $z$ axis. The pseudorapidity is defined in terms of the polar angle $\theta$ as $\eta = -\ln \tan(\theta/2)$.

The list of institutions and contributors is extensive and includes universities, research centers, and national laboratories from various countries around the world.
Faculté des Sciences, Université Mohamed Premier and LPTPM, Oujda, Morocco
Faculté des sciences, Université Mohammed V, Rabat, Morocco
CERN, Geneva, Switzerland
Enrico Fermi Institute, University of Chicago, Chicago IL, United States of America
LPC, Université Clermont Auvergne, CNRS/IN2P3, Clermont-Ferrand, France
Nevis Laboratory, Columbia University, Irvington NY, United States of America
Niels Bohr Institute, University of Copenhagen, Copenhagen, Denmark
Dipartimento di Fisica, Università della Calabria, Rende, Italy
INFN Gruppo Collegato di Cosenza, Laboratori Nazionali di Frascati, Italy
Physics Department, Southern Methodist University, Dallas TX, United States of America
Physics Department, University of Texas at Dallas, Richardson TX, United States of America
National Centre for Scientific Research “Demokritos”, Agia Paraskevi, Greece
Department of Physics, Stockholm University, Sweden
Oskar Klein Centre, Stockholm, Sweden
Deutsches Elektronen-Synchrotron DESY, Hamburg and Zeuthen, Germany
Institut für Kern- und Teilchenphysik, Technische Universität Dresden, Dresden Germany
Department of Physics, Duke University, Durham NC, United States of America
SUPA—School of Physics and Astronomy, University of Edinburgh, Edinburgh, United Kingdom
INFN e Laboratori Nazionali di Frascati, Frascati, Italy
Physikalisches Institut, Albert-Ludwigs-Universität Freiburg, Freiburg, Germany
II. Physikalisches Institut, Georg-August-Universität Göttingen, Göttingen, Germany
Département de Physique Nucléaire et Corpusculaire, Université de Genève, Genève, Switzerland
Dipartimento di Fisica, Università di Genova, Genova, Italy
INFN Sezione di Genova, Italy
II. Physikalisches Institut, Justus-Liebig-Universität Giessen, Giessen, Germany
SUPA—School of Physics and Astronomy, University of Glasgow, Glasgow, United Kingdom
LPSC, Université Grenoble Alpes, CNRS/IN2P3, Grenoble INP, Grenoble, France
Laboratory for Particle Physics and Cosmology, Harvard University, Cambridge MA, United States of America
Department of Modern Physics and State Key Laboratory of Particle Detection and Electronics, University of Science and Technology of China, Hefei, China
Institute of Frontier and Interdisciplinary Science and Key Laboratory of Particle Physics and Particle Irradiation (MOE), Shandong University, Qingdao, China
School of Physics and Astronomy, Shanghai Jiao Tong University, KLPPAC-MoE, SKLPPC, Shanghai, China
Tsung-Dao Lee Institute, Shanghai, China
Kirchhoff-Institut für Physik, Ruprecht-Karls-Universität Heidelberg, Heidelberg, Germany
Physikalisches Institut, Ruprecht-Karls-Universität Heidelberg, Heidelberg, Germany
Faculty of Applied Information Science, Hiroshima Institute of Technology, Hiroshima, Japan
Department of Physics, Chinese University of Hong Kong, Shatin, N.T., Hong Kong, China
Department of Physics, University of Hong Kong, Hong Kong, China
Department of Physics and Institute for Advanced Study, Hong Kong University of Science and Technology, Clear Water Bay, Kowloon, Hong Kong, China
Department of Physics, National Tsing Hua University, Hsinchu, Taiwan
JCLab, Université Paris-Saclay, CNRS/IN2P3, 91405, Orsay, France
Department of Physics, Indiana University, Bloomington IN, United States of America
INFN Gruppo Collegato di Udine, Sezione di Trieste, Udine, Italy
ICTP, Trieste, Italy
Dipartimento Politecnico di Ingegneria e Architettura, Università di Udine, Udine, Italy
INFN Sezione di Lecce, Italy
Dipartimento di Matematica e Fisica, Università del Salento, Lecce, Italy
INFN Sezione di Milano, Italy
Dipartimento di Fisica, Università di Milano, Milano, Italy
INFN Sezione di Napoli, Italy
Dipartimento di Fisica, Università di Napoli, Napoli, Italy
INFN Sezione di Pavia, Italy
Dipartimento di Fisica, Università di Pavia, Pavia, Italy
INFN Sezione di Pisa, Italy
Dipartimento di Fisica E. Fermi, Università di Pisa, Pisa, Italy
INFN Sezione di Roma, Italy
Dipartimento di Fisica, Sapienza Università di Roma, Roma, Italy
INFN Sezione di Roma Tor Vergata, Italy
Dipartimento di Fisica, Università di Roma Tor Vergata, Roma, Italy
INFN Sezione di Roma Tre, Italy
Dipartimento di Matematica e Fisica, Università Roma Tre, Roma, Italy
INFN-TIFPA, Italy
Università degli Studi di Trento, Trento, Italy
Institut für Astro- und Teilchenphysik, Leopold-Franzens-Universität, Innsbruck, Austria
University of Iowa, Iowa City IA, United States of America
Joint Institute for Nuclear Research, Dubna, Russia
Departamento de Engenharia Elétrica, Universidade Federal de Juiz de Fora (UFJJ), Juiz de Fora, Brazil
Universidade Federal do Rio De Janeiro COPPE/EE/IF, Rio de Janeiro, Brazil
Universidade Federal de São João del Rei (UFSJ), São João del Rei, Brazil
Instituto de Fisica, Universidade de São Paulo, São Paulo, Brazil
KEK, High Energy Accelerator Research Organization, Tsukuba, Japan
Graduate School of Science, Kobe University, Kobe, Japan
AGH University of Science and Technology, Faculty of Physics and Applied Computer Science, Krakow, Poland
Marian Smoluchowski Institute of Physics, Jagiellonian University, Krakow, Poland
Institute of Nuclear Physics Polish Academy of Sciences, Krakow, Poland
Faculty of Science, Kyoto University, Kyoto, Japan
Kyoto University of Education, Kyoto, Japan
Research Center for Advanced Particle Physics and Department of Physics, Kyushu University, Fukuoka, Japan
Instituto de Física La Plata, Universidad Nacional de La Plata and CONICET, La Plata, Argentina
Physics Department, Lancaster University, Lancaster, United Kingdom
Oliver Lodge Laboratory, University of Liverpool, Liverpool, United Kingdom
Department of Experimental Particle Physics, Jožef Stefan Institute and Department of Physics, University of Ljubljana, Ljubljana, Slovenia
School of Physics and Astronomy, Queen Mary University of London, London, United Kingdom
Department of Physics, Royal Holloway University of London, Egham, United Kingdom
Department of Physics and Astronomy, University College London, London, United Kingdom
Louisiana Tech University, Ruston LA, United States of America
Research Center de l’Institut National de Physique Nucléaire et de Physique des Particules (IN2P3), Villeurbanne, France
Instituto de Física Teorica C-15 and CIAFF, Universidad Autónoma de Madrid, Madrid, Spain
Institut für Physik, Universität Mainz, Mainz, Germany
School of Physics and Astronomy, University of Manchester, Manchester, United Kingdom
CPPM, Aix-Marseille Université, CNRS/IN2P3, Marseille, France
Department of Physics, University of Massachusetts, Amherst MA, United States of America
School of Physics, University of Melbourne, Victoria, Australia
Department of Physics, University of Michigan, Ann Arbor MI, United States of America
Department of Physics and Astronomy, Michigan State University, East Lansing MI, United States of America
B.I. Stepanov Institute of Physics, National Academy of Sciences of Belarus, Minsk, Belarus
Research Institute for Nuclear Problems of Byelorussian State University, Minsk, Belarus
Group of Particle Physics, University of Montreal, Montreal QC, Canada
National Research Nuclear University MEPhI, Moscow, Russia
D.V. Skobeltsyn Institute of Nuclear Physics, M.V. Lomonosov Moscow State University, Moscow, Russia
Fakultät für Physik, Ludwig-Maximilians-Universität München, München, Germany
Max-Planck-Institut für Physik (Werner-Heisenberg-Institut), München, Germany
Nagasaki Institute of Applied Science, Nagasaki, Japan
Graduate School of Science and Kobayashi-Maskawa Institute, Nagoya University, Nagoya, Japan
Department of Physics and Astronomy, University of New Mexico, Albuquerque NM, United States of America
Institute for Mathematics, Astrophysics and Particle Physics, Radboud University Nijmegen/Nikhef, Nijmegen, Netherlands
Nikhef National Institute for Subatomic Physics and University of Amsterdam, Amsterdam, Netherlands
Budker Institute of Nuclear Physics and NSU, SB RAS, Novosibirsk, Russia
Novosibirsk State University Novosibirsk, Russia
Institute for High Energy Physics of the National Research Centre Kurchatov Institute, Protvino, Russia
institute for Theoretical and Experimental Physics named by A.I. Alikhanov of National Research Centre “Kurchatov Institute”, Moscow, Russia

Department of Physics, New York University, New York NY, United States of America

Department of Physics, Tokyo Institute of Technology, Tokyo, Japan

Ohio State University, Columbus OH, United States of America

Homer L. Dodge Department of Physics and Astronomy, University of Oklahoma, Norman OK, United States of America

Department of Physics, Oklahoma State University, Stillwater OK, United States of America

Palacký University, RCPTM, Joint Laboratory of Optics, Olomouc, Czech Republic

Institute for Fundamental Science, University of Oregon, Eugene, OR, United States of America

Graduate School of Science, Osaka University, Osaka, Japan

Department of Physics, University of Oslo, Oslo, Norway

Department of Physics, Oxford University, Oxford, United Kingdom

LPNHE, Sorbonne Université, Université de Paris, CNRS/IN2P3, Paris, France

Department of Physics, University of Pennsylvania, Philadelphia PA, United States of America

Konstantinov Nuclear Physics Institute of National Research Centre

Laboratório de Instrumentação e Física Experimental de Partículas—LIP, Lisboa, Portugal

Departamento de Física, Faculdade de Ciências, Universidade de Lisboa, Portugal

Depto de Física, Faculdade de Ciências e Tecnologia, Universidade Nova de Lisboa, Caparica, Portugal

Instituto Superior Técnico, Universidade de Lisboa, Lisbon, Portugal

Institute of Physics of the Czech Academy of Sciences, Prague, Czech Republic

Czech Technical University in Prague, Prague, Czech Republic

Charles University, Faculty of Mathematics and Physics, Prague, Czech Republic

Particle Physics Department, Rutherford Appleton Laboratory, Didcot, United Kingdom

IFU, CEA, Université Paris-Saclay, Gif-sur-Yvette, France

Santa Cruz Institute for Particle Physics, University of California Santa Cruz, Santa Cruz CA, United States of America

Departamento de Física, Pontificia Universidad Católica de Chile, Santiago, Chile

Universidad Andres Bello, Department of Physics, Santiago, Chile

Instituto de Alta Investigación, Universidade de Tarapacá, Chile

Departamento de Física, Universidad Técnica Federico Santa María, Valparaíso, Chile

Department of Physics, University of Washington, Seattle WA, United States of America

Department of Physics and Astronomy, University of Sheffield, Sheffield, United Kingdom

Department of Physics, Shinshu University, Nagano, Japan

Department Physik, Universität Siegen, Siegen, Germany

Department of Physics, Simon Fraser University, Burnaby BC, Canada

SLAC National Accelerator Laboratory, Stanford CA, United States of America

Physics Department, Royal Institute of Technology, Stockholm, Sweden

Departments of Physics and Astronomy, Stony Brook University, Stony Brook NY, United States of America

Department of Physics and Astronomy, University of Sussex, Brighton, United Kingdom

School of Physics, University of Sydney, Sydney, Australia

Institute of Physics, Academia Sinica, Taipei, Taiwan

E. Andronikashvili Institute of Physics, Iv. Javakhishvili Tbilisi State University, Tbilisi, Georgia

High Energy Physics Institute, Tbilisi State University, Tbilisi, Georgia

Department of Physics, Technion, Israel Institute of Technology, Haifa, Israel

Raymond and Beverly Sackler School of Physics and Astronomy, Tel Aviv University, Tel Aviv, Israel

Department of Physics, Aristotle University of Thessaloniki, Thessaloniki, Greece

International Center for Elementary Particle Physics and Department of Physics, University of Tokyo, Tokyo, Japan

Graduate School of Science and Technology, Tokyo Metropolitan University, Tokyo, Japan

Department of Physics, Tokyo Institute of Technology, Tokyo, Japan

Tomsk State University, Tomsk, Russia

Department of Physics, University of Toronto, Toronto ON, Canada

TRIUMF, Vancouver BC, Canada

Department of Physics and Astronomy, York University, Toronto ON, Canada

Division of Physics and Tomonaga Center for the History of the Universe, Faculty of Pure and Applied Sciences, University of Tsukuba, Tsukuba, Japan

Department of Physics and Astronomy, Tufts University, Medford MA, United States of America
170 Department of Physics and Astronomy, University of California Irvine, Irvine CA, United States of America
171 Department of Physics and Astronomy, University of Uppsala, Uppsala, Sweden
172 Department of Physics, University of Illinois, Urbana IL, United States of America
173 Instituto de Física Corpuscular (IFIC), Centro Mixto Universidad de Valencia—CSIC, Valencia, Spain
174 Department of Physics, University of British Columbia, Vancouver BC, Canada
175 Department of Physics and Astronomy, University of Victoria, Victoria BC, Canada
176 Fakultät für Physik und Astronomie, Julius-Maximilians-Universität Würzburg, Würzburg, Germany
177 Department of Physics, University of Warwick, Coventry, United Kingdom
178 Waseda University, Tokyo, Japan
179 Department of Particle Physics, Weizmann Institute of Science, Rehovot, Israel
180 Department of Physics, University of Wisconsin, Madison WI, United States of America

*Deceased.
†Also at Department of Physics, King’s College London, London, United Kingdom.
‡ Also at Instituto de Física Teorica, IFT-UAM/CSIC, Madrid, Spain.
§ Also at TRIUMF, Vancouver BC, Canada.
¶ Also at Department of Physics and Astronomy, University of Louisville, Louisville, KY, United States of America.
† Also at Physics Department, An-Najah National University, Nablus, Palestine.
‡ Also at Department of Physics, University of Fribourg, Fribourg, Switzerland.
¶ Also at Departament de Física de la Universitat Autònoma de Barcelona, Barcelona, Spain.
† Also at Moscow Institute of Physics and Technology State University, Dolgoprudny, Russia.
‡ Also at Department of Physics, Ben Gurion University of the Negev, Beer Sheva, Israel.
¶ Also at Universita di Napoli Parthenope, Napoli, Italy.
† Also at Institute of Particle Physics (IPP), Vancouver, Canada.
§ Also at Department of Physics, University of Adelaide, Adelaide, Australia.
¶ Also at Dipartimento di Matematica, Informatica e Fisica, Università di Udine, Udine, Italy.
† Also at Department of Physics, St. Petersburg State Polytechnical University, St. Petersburg, Russia.
‡ Also at Borough of Manhattan Community College, City University of New York, New York NY, United States of America.
¶ Also at Department of Physics, California State University, Fresno, United States of America.
† Also at Department of Financial and Management Engineering, University of the Aegean, Chios, Greece.
‡ Also at Department of Physics, California State University, East Bay, United States of America.
¶ Also at Institucio Catalana de Recerca i Estudis Avancats, ICREA, Barcelona, Spain.
† Also at IJCLab, Université Paris-Saclay, CNRS/IN2P3, 91405, Orsay, France.
‡ Also at Graduate School of Science, Osaka University, Osaka, Japan.
¶ Also at Physikalisches Institut, Albert-Ludwigs-Universität Freiburg, Freiburg, Germany.
† Also at Institute of Physics, Azerbaijan Academy of Sciences, Baku, Azerbaijan.
‡ Also at Institute for Mathematics, Astrophysics and Particle Physics, Radboud University Nijmegen/Nikhef, Nijmegen, Netherlands.
¶ Also at CERN, Geneva, Switzerland.
† Also at Joint Institute for Nuclear Research, Dubna, Russia.
‡ Also at Hellenic Open University, Patras, Greece.
¶ Also at The City College of New York, New York NY, United States of America.
† Also at Department of Physics, California State University, Sacramento, United States of America.
‡ Also at Département de Physique Nucléaire et Corpusculaire, Université de Genève, Genève, Switzerland.
¶ Also at Louisiana Tech University, Ruston LA, United States of America.
† Also at Institute for Nuclear Research and Nuclear Energy (INRNE) of the Bulgarian Academy of Sciences, Sofia, Bulgaria.
‡ Also at Faculty of Physics, M.V. Lomonosov Moscow State University, Moscow, Russia.
¶ Also at Applied Physics and Astronomy, University of Sharjah, Sharjah, United Arab Emirates.
† Also at Institut für Experimentalphysik, Universität Hamburg, Hamburg, Germany.
‡ Also at CPPM, Aix-Marseille Université, CNRS/IN2P3, Marseille, France.
¶ Also at National Research Nuclear University MEPhI, Moscow, Russia.
† Also at Institute of Physics, Azerbaijan Academy of Sciences, Baku, Azerbaijan.
‡ Also at Institute for Particle and Nuclear Physics, Wigner Research Centre for Physics, Budapest, Hungary.
¶ Also at Giresun University, Faculty of Engineering, Giresun, Turkey.
† Also at Department of Physics and Astronomy, Michigan State University, East Lansing MI, United States of America.
