Search for Heavy Higgs Bosons $A/H$ Decaying to a Top Quark Pair in $pp$ Collisions at $\sqrt{s} = 8$ TeV with the ATLAS Detector

M. Aaboud et al.*
(ATLAS Collaboration)
(Received 20 July 2017; published 9 November 2017)

A search for heavy pseudoscalar ($A$) and scalar ($H$) Higgs bosons decaying into a top quark pair ($t\bar{t}$) has been performed with 20.3 fb$^{-1}$ of proton-proton collision data collected by the ATLAS experiment at the Large Hadron Collider at a center-of-mass energy $\sqrt{s} = 8$ TeV. Interference effects between the signal process and standard model $t\bar{t}$ production, which are expected to distort the signal shape from a single peak to a peak-dip structure, are taken into account. No significant deviation from the standard model prediction is observed in the $t\bar{t}$ invariant mass spectrum in final states with an electron or muon, large missing transverse momentum, and at least four jets. The results are interpreted within the context of a type-II two-Higgs-doublet model. Exclusion limits on the signal strength are derived as a function of the mass $m_{A/H}$ and the ratio of the vacuum expectation values of the two Higgs fields, $\tan\beta$, for $m_{A/H} > 500$ GeV.

DOI: 10.1103/PhysRevLett.119.191803

Introduction.—The production of new particles at the Large Hadron Collider (LHC) with masses close to the TeV scale is predicted by many models of physics beyond the standard model (SM). In this Letter, a search for massive pseudoscalar and scalar resonances decaying into a top-antitop quark pair ($t\bar{t}$) is presented. It is the first search in this final state to take into account the significant interference between the signal and the background from SM $t\bar{t}$ production. The search is conducted on a sample of $pp$ collision data with an integrated luminosity of 20.3 fb$^{-1}$ at a center-of-mass energy $\sqrt{s} = 8$ TeV, collected with the ATLAS detector [1].

New pseudoscalar ($A$) and scalar ($H$) states coupling strongly to $t\bar{t}$ are predicted by a class of models in which the Higgs sector is extended to include a second Higgs doublet, the two-Higgs-doublet models (2HDMs) [2]. These models are motivated by many theories beyond the SM, such as supersymmetry [3–8] and axion models [9]. In 2HDMs of type II [2], such as the minimal supersymmetric standard model (MSSM) [10–14], these states decay predominantly into $t\bar{t}$ pairs if $m_{A/H} \geq 500$ GeV and the ratio of the vacuum expectation values of the two Higgs fields, $\tan\beta$, is small ($\tan\beta \lesssim 3$).

To date, this parameter region has not been probed directly by searches in other final states [15–20] or by previous searches for $t\bar{t}$ resonances [21–25]. The latter, which aim to identify resonant excesses in the $t\bar{t}$ invariant mass ($m_{t\bar{t}}$) spectrum, have a reduced sensitivity to 2HDM signatures as they do not take into account interference effects between the signal and the dominant background from SM $t\bar{t}$ production. These are significant for (pseudo) scalar Higgs bosons with masses above the $t\bar{t}$ production threshold where the interference between the gluon-gluon ($gg$) initiated loop production and the irreducible background from SM $t\bar{t}$ production yields a non-negligible imaginary term in the amplitude, which at the LHC is dominated by $gg \to t\bar{t}$ production [26–31]. As a result of the interference, the signal shape is distorted from a Breit-Wigner peak to a peak-dip structure.

The results of the search are interpreted in a $CP$-conserving type-II 2HDM with a softly broken $Z_2$ symmetry [32]. The lighter of the two neutral $CP$-even states, $h$, is assumed to be the Higgs boson discovered at a mass of $m_h = 125$ GeV [33,34] with couplings as predicted by the SM. This corresponds to the condition $\sin(\alpha - \beta) = 1$, referred to as the alignment limit, where $\alpha$ denotes the mixing angle between the two $CP$-even states. The parameter $m_{12}$ of the $Z_2$ breaking term of the potential is taken to be $m_{12}^2 = m_A^2 \tan\beta/(1 + \tan^2\beta)$. In this model, the production cross sections and widths of $A$ and $H$, as well as the signal shape, are determined by $\tan\beta$ and the masses $m_A$ and $m_H$. The search results are derived assuming mass degeneracy, $m_H = m_A$, such that both processes contribute to the $m_{t\bar{t}}$ spectrum, a scenario motivated, for example, by the MSSM [32]. We also consider two scenarios in which only the interference pattern of either $A$ or $H$ appears in the $m_{t\bar{t}}$ spectrum [35].

Data and Monte Carlo samples.—This analysis closely follows the resolved-topology analysis in Ref. [22]. Events with signatures compatible with $t\bar{t} \to W^+bW^−\bar{b}$, with one
W boson decaying hadronically and the other leptonically, the lepton-plus-jets channel ($\ell + jets$, $\ell = e, \mu$), were collected using single-electron and single-muon triggers. The trigger efficiency is constant in the transverse momentum ($p_T$) of leptons with $p_T > 25$ GeV [36,37]. The dominant background arises from SM $t \bar{t}$ production, followed by a contribution from $W +$ jets processes. Data-driven techniques were used to normalize the $W +$ jets background contribution and to estimate the background from multijet events. All other background processes were estimated using Monte Carlo (MC) simulation. The background estimates for all processes are identical to those in Ref. [22].

The signal process $gg \rightarrow A/H \rightarrow t \bar{t}$, including the decays of the top quarks and resulting $W$ bosons, was simulated using MadGraph5_aMC@NLO [38] v2.3.3 with the model of Ref. [39], which implements the $A/H$ production through loop-induced gluon-gluon fusion with loop contributions from top and bottom quarks at leading order (LO) in QCD. The CT10 set [40] of parton distribution functions (PDFs) was used and the renormalization and factorization scales were set to $\sqrt{\sum \text{decay products}(p_T^2 + m^2)}$.

For the statistical interpretation, the $t \bar{t}$ invariant mass distributions in the signal regions in data were compared to a combination of the expected distributions from all background processes $B$, the pure signal process $S$, and the signal-plus-interference component $S + I$ for a given signal hypothesis, as illustrated in Eq. (1) below. The most reliable description of the $t \bar{t}$ background [41] is obtained at next-to-leading order (NLO) with POWHEG-BOX [42–45] + PYTHIA6 [46]. Therefore, the $S + I$ contribution was modeled separately from this background process by modifying the MadGraph5_aMC@NLO software to remove the pure SM $t \bar{t}$ process to yield only the $S + I$ contribution on an event-by-event basis. The nominal $t \bar{t}$ background prediction in $m_{t \bar{t}}$ is in good agreement with that obtained from MadGraph5_aMC@NLO in all signal regions. The $S + I$ events obtained with the modified software can have positive or negative weights. Figure 1 shows the $t \bar{t}$ invariant mass distributions for the $S$ and $S + I$ components in a model with $\tan \beta = 0.68$ and a pseudoscalar of mass $m_A = 500$ GeV. The $S + I$ component exhibits a peak-dip structure with the minimum around $m_{A/H}$ for all signal hypotheses studied in this search. The width of both the $S$ and $S + I$ distribution decreases with increasing $\tan \beta$.

The $S + I$ distributions from the modified MadGraph5_aMC@NLO software were validated against those from the unmodified program. The latter were obtained by generating a large inclusive sample $S + I + B_{\bar{t}}$ for a given parameter point and a LO SM $t \bar{t}$ background $B_{t \bar{t}}$ sample with the same generator settings. The difference between the resulting two $m_{t \bar{t}}$ distributions corresponds to the $S + I$ component, which agrees with that obtained with the modified software within 0.4% across the whole spectrum. The difference is taken as a systematic uncertainty in $S + I$.

PYTHIA6 with the Perugia 2011c set of tuned parameters [47] was used to model the parton shower and hadronization for all $S$ and $S + I$ samples and the stable particles obtained after hadronization were passed through the ATLAS fast detector simulation [48]. The effects of additional collisions within the same or nearby bunch crossings were simulated by overlaying additional $pp$ collisions, simulated with PYTHIA V8.1 [49], on each event. Correction factors were applied to adjust the trigger and selection efficiencies in simulated events to those measured in data. The $S$ and $S + I$ samples with this setup were generated separately for pseudoscalar and scalar Higgs bosons.

Event samples for both the $S$ and $S + I$ components for different values of ($m_{A/H}, \tan \beta$) were obtained from signal samples $S$ after the detector simulation by applying an event-by-event reweighting. This reweighting substantially reduces the computing time required. The weight is the ratio of the MadGraph5_aMC@NLO matrix elements, calculated from the four-momenta of the incoming gluons and outgoing top quarks of the generated event with the new and the old values of ($m_{A/H}, \tan \beta$), respectively. All $S + I$ and a small number of $S$ samples were obtained through reweighting. Signal hypotheses with $m_{A/H} < 500$ GeV were not considered as they require an accurate modeling of the Higgs boson decay into virtual top quarks and the implementation of higher-order corrections that are not available in the MadGraph5_aMC@NLO model. The requirement $\tan \beta \geq 0.4$ was imposed to ensure the perturbativity of the top-quark Yukawa coupling [2].

Correction factors $K_S$ were applied to normalize the generated signal ($S$) cross section to the value calculated at partial next-to-next-to-leading-order (NNLO) precision in...
QCD [50-52]. The correction factor for the interference component $i$ is $K_i = \sqrt{K_S \times K_B}$, as suggested in Ref. [53], where $K_B = 1.87$ is the correction factor to normalize the total cross section of the SM $t\bar{t}$ background generated at LO with MADGRAPH to the cross section calculated at NNLO accuracy in the strong coupling constant $\alpha_s$, including resummation of next-to-next-to-leading-logarithmic soft gluon terms. The values of $K_S$ range between two and three for the tested signal hypotheses.

Event selection.—The event selection criteria for the signal regions provide a high selection efficiency for $t\bar{t}$ events. Only events with a resolved topology, in which the three jets from the hadronically decaying top quark are well separated in the detector, are selected. This is the most efficient selection strategy for signal hypotheses with $m_A/H < 800$ GeV. Events with a merged topology, in which the top quark is reconstructed as a single jet, are not considered. The event reconstruction and selection criteria are identical to those in Ref. [22] except that events that would satisfy the criteria for both topologies are classified as “resolved” instead of “merged.”

Events are required to contain exactly one isolated electron [54] or muon [55] with $p_T > 25$ GeV and pseudorapidity $|\eta| < 2.5$ [56]. Events must have large missing transverse momentum, $E_T^{miss} > 20$ GeV, computed as the magnitude of the negative vector sum of lepton and jet transverse momenta [57]. In addition, $E_T^{miss} + m_W^T > 60$ GeV is required to further suppress the contribution from multijet events, where $m_W^T$ is the lepton–jet transverse mass [22]. Events must contain at least four hadronic jets with $p_T > 25$ GeV and $|\eta| < 2.5$, reconstructed using the anti-$k_t$ algorithm [58,59] with radius parameter $R = 0.4$. Jets from additional collisions in the same bunch crossing are rejected using dedicated tracking and vertex requirements [60]. At least one of the jets must be identified as originating from the decay of a $b$-hadron ($b$-jet) using a multivariate tagging algorithm with a 70% efficiency for $b$-jets and light-quark and gluon mistag rates of 0.5%–2% [61].

Event reconstruction.—Jets are assigned to the top quarks using a $\chi^2$ algorithm that relies on kinematic constraints and the expected values of the top quark and $W$ boson masses [22]. The invariant mass $m_{t\bar{t}}$ reco of the candidate $t\bar{t}$ pair is reconstructed from the four selected jets, the lepton, and the $E_T^{miss}$ vector. The experimental resolution for the $t\bar{t}$ invariant mass is 8% for $m_A/H = 500$ GeV. Events in the $e +$ jets and $\mu +$ jets channels are classified into three categories, based on whether a $b$-tagged jet was assigned to either the hadronically or the semileptonically decaying top quark, or to both of them. Each category defines a signal region; hence six orthogonal signal regions are used in the statistical analysis.

Systematic uncertainties.—The impact of the systematic uncertainties on both the normalization and the shape of the $m_{t\bar{t}}$ reco distributions is taken into account. The average impact of the dominant uncertainties on the event yields is summarized in Table I.

The experimental uncertainties with the largest impact on the event yields and the shape of the $m_{t\bar{t}}$ reco distributions are those related to the jet energy scale (JES) and the jet energy resolution (JER) [63,64], followed by uncertainties on the $b$-tagging efficiency and misidentification rates [61]. The uncertainties related to leptons include those in the reconstruction and isolation efficiency, the single-lepton triggers, and the energy scale and resolution [54,55].

The uncertainty of 6.5% in the NNLO + NLL cross section for SM $t\bar{t}$ production is the dominant uncertainty in the total background normalization [22]. Modeling uncertainties affecting the shape of the $m_{t\bar{t}}$ reco distribution for the SM $t\bar{t}$ background are also taken into account. These

include uncertainties related to the choice of NLO event generator, the modeling of the parton shower and fragmentation, the modeling of gluon initial- and final-state radiation, and the value of the top quark mass $m_t$. Other sources of uncertainty related to the various background components are described in Ref. [22]. The largest uncertainty in the modeling of the $S + I$ and $S$ components is related to the $\pm 1.0$ GeV uncertainty of the value $m_t = 172.5$ GeV [65]. Uncertainties related to the choice of PDF set and renormalization and factorization scales are also considered. The latter is estimated by varying the scales by factors of 0.5 and 2.0, which yields a constant $\pm 7.3\%$ variation across the $m_{t_{\text{reco}}}^{\text{reco}}$ spectrum. An asymmetric variation, for which the bins at the low and high ends of the $m_{t_{\text{reco}}}^{\text{reco}}$ spectrum are taken as anticorrelated [66] is also considered to estimate the impact of the scale variations on the shape of the $m_{t_{\text{reco}}}^{\text{reco}}$ spectrum. For the $S + I$ samples, an additional constant $\pm 5\%$ uncertainty is included to cover the difference between reweighted and generated distributions.

**Results.**—A breakdown of the observed and expected event yields in the $e +$ jets and $\mu +$ jets channels and their total uncertainties is shown in Table II. Good agreement is found between the observed number of events in data and the expected total number of background events.

The exclusion limits are derived separately for each signal hypothesis from a profile-likelihood fit [67] of the expected $m_{t_{\text{reco}}}^{\text{reco}}$ distributions to the observed ones simultaneously in all signal regions, taking the statistical and systematic uncertainties into account as nuisance parameters [22]. Only bins with $m_{t_{\text{reco}}}^{\text{reco}} > 320$ GeV are considered to avoid threshold effects not well described by the simulation. The shape of the binned $m_{t_{\text{reco}}}^{\text{reco}}$ distributions is parametrized in terms of the signal strength $\mu$ [26,27]:

$$\mu S + \sqrt{\mu}I + B = (\mu - \sqrt{\mu})S + \sqrt{\mu}(S + I) + B. \quad (1)$$

The fitted variable is $\sqrt{\mu}$ and the case $\mu = 1$ ($\mu = 0$) corresponds to the type-II 2HDM in the alignment limit (the background-only hypothesis). This approach relies on the assumption that, for a given signal hypothesis, the shape of the $t\bar{t}$ invariant mass distributions for $S$ and $S + I$ in Eq. (1) does not change with $\mu$. The terms $S$ and $S + I$ on the right-hand side of Eq. (1) correspond to the $m_{t_{\text{reco}}}^{\text{reco}}$ distributions obtained from the $S$ and $S + I$ samples, respectively, while $B$ stands for the expected $m_{t_{\text{reco}}}^{\text{reco}}$ distribution of the total background.

The level of agreement between the observed and expected mass spectra is quantified in a fit under the background-only hypothesis in which only the nuisance parameters are allowed to vary. The observed $m_{t_{\text{reco}}}^{\text{reco}}$ spectra are compatible with the postfit expected spectra within the (constrained) uncertainty bands (Fig. 2).

The upper limits on $\mu$ at 95% confidence level (C.L.) are obtained with the C.L.s method [68] for a number of $(m_{A/\mu}, \tan \beta)$ values. The upper limits at intermediate points are obtained from a linear interpolation among

FIG. 2. Distribution of $m_{t_{\text{reco}}}^{\text{reco}}$ for the data and the expected background after the profile-likelihood fit under the background-only hypothesis for all signal regions combined. The lines in the bottom panel show the individual $S + I$ distributions (scaled by a factor of 4) for a pseudoscalar $A$ (solid line) and scalar $H$ (bold dashed line) with $m_{A/\mu} = 500$ GeV and $\tan \beta = 0.68$ relative to the total background.

FIG. 3. The 95% C.L. observed and expected exclusion regions for the type-II 2HDM ($\mu = 1$) considering only a pseudoscalar $A$ (left), only a scalar $H$ (middle), and the mass-degenerate scenario $m_A = m_H$ (right). Blue points indicate parameter values at which signal samples are produced.

The three closest points. In Fig. 3, the observed and expected exclusion regions for the type-II 2HDM (\( \mu = 1 \)) are shown for the three scenarios discussed in the Introduction. The excluded values of \( \tan \beta \) for the different mass hypotheses are listed in Table III.

Conclusion. —In conclusion, the search for massive pseudoscalar and scalar resonances decaying to \( \tilde{t}\tilde{t} \) in 20.3 fb\(^{-1} \) of \( pp \) collisions at 8 TeV recorded by the ATLAS experiment yields no statistically significant deviations from the SM prediction. The results are interpreted in a type-II 2HDM in the alignment limit, and upper limits are set on the signal strength \( \mu \) at 95% C.L. in the \( m_{A/H} \) versus \( \tan \beta \) plane. Unlike previous searches for \( \tilde{t}\tilde{t} \) resonances, this analysis takes into account interference effects between the signal process and the background from SM \( \tilde{t}\tilde{t} \) production. It tightens significantly the previously published constraints on the 2HDM parameter space in the low \( \tan \beta \) and high mass (\( m_{A/H} > 500 \text{ GeV} \)) region.

We thank CERN for the very successful operation of the LHC, as well as the support staff from our institutions without whom ATLAS could not be operated efficiently. 36 Department of Modern Physics and State Key Laboratory of Particle Detection and Electronics, University of Science and Technology of China, Anhui, China
37 School of Physics, Shandong University, Shandong, China
38 Université Clermont Auvergne, CNRS/IN2P3, LPC, Clermont-Ferrand, France
39 Nevis Laboratory, Columbia University, Irvington New York, USA
40 INFN Gruppo Collegato di Cosenza, Laboratori Nazionali di Frascati, Italy
41 AGH University of Science and Technology, Faculty of Physics and Applied Computer Science, Krakow, Poland
42 Marian Smoluchowski Institute of Physics, Jagiellonian University, Krakow, Poland
43 Institute of Nuclear Physics Polish Academy of Sciences, Krakow, Poland
44 Physics Department, Southern Methodist University, Dallas Texas, USA
45 Physics Department, University of Texas at Dallas, Richardson Texas, USA
46 DESY, Hamburg and Zeuthen, Germany
47 Lehrstuhl für Experimentelle Physik IV, Technische Universität Dortmund, Dortmund, Germany
48 Institut für Kern- und Teilchenphysik, Technische Universität Dresden, Dresden, Germany
49 Department of Physics, Duke University, Durham North Carolina, USA
50 SUPA - School of Physics and Astronomy, University of Edinburgh, Edinburgh, United Kingdom
51 Fakultät für Mathematik und Physik, Albert-Ludwigs-Universität, Freiburg, Germany
52 Département de Physique Nucléaire et Corpusculaire, Université de Genève, Geneva, Switzerland
53 INFN Sezione di Genova, Italy
54 E. Andronikashvili Institute of Physics, Iv. Javakhishvili Tbilisi State University, Tbilisi, Georgia
55 High Energy Physics Institute, Tbilisi State University, Tbilisi, Georgia
56 SUPA - School of Physics and Astronomy, University of Glasgow, Glasgow, United Kingdom
57 II Physikalisches Institut, Justus-Liebig-Universität Giessen, Giessen, Germany
58 Laboratory for Particle Physics and Cosmology, Harvard University, Cambridge Massachusetts, USA
Kirchhoff-Institut für Physik, Ruprecht-Karls-Universität Heidelberg, Heidelberg, Germany
Physikalisches Institut, Ruprecht-Karls-Universität Heidelberg, Heidelberg, Germany
Faculty of Applied Information Science, Hiroshima Institute of Technology, Hiroshima, Japan
Department of Physics, The Chinese University of Hong Kong, Shatin, N.T., Hong Kong, China
Department of Physics, The University of Hong Kong, Hong Kong, China
Department of Physics and Institute for Advanced Study, The Hong Kong University of Science and Technology, Clear Water Bay, Kowloon, Hong Kong, China
Department of Physics, National Tsing Hua University, Taiwan, Taiwan
Department of Physics, Indiana University, Bloomington Indiana, USA
Institut für Astro- und Teilchenphysik, Leopold-Franzens-Universität, Innsbruck, Austria
University of Iowa, Iowa City Iowa, USA
Department of Physics and Astronomy, Iowa State University, Ames Iowa, USA
Joint Institute for Nuclear Research, JINR Dubna, Dubna, Russia
KEK, High Energy Accelerator Research Organization, Tsukuba, Japan
Graduate School of Science, Kobe University, Kobe, Japan
Faculty of Science, Kyoto University, Kyoto, Japan
Kyoto University of Education, Kyoto, Japan
Research Center for Advanced Particle Physics and Department of Physics, Kyushu University, Fukuoka, Japan
Instituto de Física La Plata, Universidad Nacional de La Plata and CONICET, La Plata, Argentina
Physics Department, Lancaster University, Lancaster, United Kingdom
INFN Sezione di Lecce, Italy
Dipartimento di Matematica e Fisica, Università del Salento, Lecce, Italy
Oliver Lodge Laboratory, University of Liverpool, Liverpool, United Kingdom
Department of Experimental Particle Physics, Jožef Stefan Institute and Department of Physics, University of Ljubljana, Ljubljana, Slovenia
School of Physics and Astronomy, Queen Mary University of London, London, United Kingdom
Department of Physics, Royal Holloway University of London, Surrey, United Kingdom
Department of Physics and Astronomy, University College London, London, United Kingdom
Louisiana Tech University, Ruston Louisiana, USA
Laboratoire de Physique Nucléaire et de Hautes Énergies, UPMC and Université Paris-Diderot and CNRS/IN2P3, Paris, France
Fysiska institutionen, Lunds universitet, Lund, Sweden
Departamento de Física Teórica C-15, Universidad Autonoma de Madrid, Madrid, Spain
Institut für Physik, Universität Mainz, Mainz, Germany
School of Physics and Astronomy, University of Manchester, Manchester, United Kingdom
CPPM, Aix-Marseille Université and CNRS/IN2P3, Marseille, France
Department of Physics, University of Massachusetts, Amherst Massachusetts, USA
Department of Physics, McGill University, Montreal Québec, Canada
School of Physics, University of Melbourne, Victoria, Australia
Department of Physics, The University of Michigan, Ann Arbor Michigan, USA
Department of Physics and Astronomy, Michigan State University, East Lansing Michigan, USA
INFN Sezione di Milano, Italy
Dipartimento di Fisica, Università di Milano, Milano, Italy
B.I. Stepanov Institute of Physics, National Academy of Sciences of Belarus, Minsk, Republic of Belarus
Research Institute for Nuclear Problems of Byelorussian State University, Minsk, Republic of Belarus
Group of Particle Physics, University of Montreal, Montreal QuébecCanada
P.N. Lebedev Physical Institute of the Russian Academy of Sciences, Moscow, Russia
Institute for Theoretical and Experimental Physics (ITEP), Moscow, Russia
National Research Nuclear University MEPhI, Moscow, Russia
D.V. Skobeltsyn Institute of Nuclear Physics, M.V. Lomonosov Moscow State University, Moscow, Russia
Fakultät für Physik, Ludwig-Maximilians-Universität München, München, Germany
Max-Planck-Institut für Physik (Werner-Heisenberg-Institut), München, Germany
Nagasaki Institute of Applied Science, Nagasaki, Japan
Graduate School of Science and Kobayashi-Maskawa Institute, Nagoya University, Nagoya, Japan
INFN Sezione di Napoli, Italy
Dipartimento di Fisica, Università di Napoli, Napoli, Italy
Department of Physics and Astronomy, University of New Mexico, Albuquerque New Mexico, USA
Institute for Mathematics, Astrophysics and Particle Physics, Radboud University Nijmegen/Nikhef, Nijmegen, Netherlands
Nikhef National Institute for Subatomic Physics and University of Amsterdam, Amsterdam, Netherlands
Department of Physics, Northern Illinois University, DeKalb Illinois, USA
Budker Institute of Nuclear Physics, SB RAS, Novosibirsk, Russia
112 Department of Physics, New York University, New York New York, USA
113 Ohio State University, Columbus Ohio, USA
114 Faculty of Science, Okayama University, Okayama, Japan
115 Homer L. Dodge Department of Physics and Astronomy, University of Oklahoma, Norman Oklahoma, USA
116 Department of Physics, Oklahoma State University, Stillwater Oklahoma, USA
117 Palacky University, RCPTM, Olomouc, Czech Republic
118 Center for High Energy Physics, University of Oregon, Eugene Oregon, USA
119 LAL, Univ. Paris-Sud, CNRS/IN2P3, Université Paris-Saclay, Orsay, France
120 Graduate School of Science, Osaka University, Osaka, Japan
121 Department of Physics, University of Oslo, Oslo, Norway
122 Department of Physics, Oxford University, Oxford, United Kingdom
123 INFN Sezione di Pavia, Italy
124 Department of Physics, University of Pennsylvania, Philadelphia Pennsylvania, USA
125 National Research Centre “Kurchatov Institute” B.P.Konstantinov Petersburg Nuclear Physics Institute, St. Petersburg, Russia
126 INFN Sezione di Pisa, Italy
127 Department of Physics and Astronomy, University of Pittsburgh, Pittsburgh Pennsylvania, USA
128 Laboratório de Instrumentação e Física Experimental de Partículas - LIP, Lisboa, Portugal
129 Institute of Physics, Academy of Sciences of the Czech Republic, Praha, Czech Republic
130 Czech Technical University in Prague, Praha, Czech Republic
131 Charles University, Faculty of Mathematics and Physics, Prague, Czech Republic
132 State Research Center Institute for High Energy Physics (Protvino), NRC KI, Russia
133 Particle Physics Department, Rutherford Appleton Laboratory, Didcot, United Kingdom
134 INFN Sezione di Roma, Italy
135 INFN Sezione di Roma Tor Vergata, Italy
136 INFN Sezione di Roma Tre, Italy
137 Faculté des Sciences Ain Chock, Réseau Universitaire de Physique des Hautes Energies - Université Hassan II, Casablanca, Morocco
138 Dep Fisica and CEFITEC de Faculdade de Ciencias e Tecnologia, Universidade Nova de Lisboa, Caparica, Portugal
139 Institute of Physics, University of California Santa Cruz, Santa Cruz California, USA
140 Department of Physics, University of Washington, Seattle Washington, USA
141 Department of Physics and Astronomy, University of Sheffield, Sheffield, United Kingdom
142 Department of Physics, Shinshu University, Nagano, Japan
143 Department Physik, Universität Siegen, Siegen, Germany
144 Department of Physics, Simon Fraser University, Burnaby British Columbia, Canada
145 SLAC National Accelerator Laboratory, Stanford California, USA
146 Faculty of Mathematics, Physics & Informatics, Comenius University, Bratislava, Slovak Republic
147 Department of Subnuclear Physics, Institute of Experimental Physics of the Slovak Academy of Sciences, Kosice, Slovak Republic
148 Department of Physics, University of Cape Town, Cape Town, South Africa
149 Department of Physics, University of Johannesburg, Johannesburg, South Africa
150 Departments of Physics & Astronomy and Chemistry, Stony Brook University, Stony Brook New York, USA
151 Department of Physics and Astronomy, University of Sussex, Brighton, United Kingdom
152 School of Physics, University of Sydney, Sydney, Australia
153 Institute of Physics, Academia Sinica, Taipei, Taiwan
154 Department of Physics, Technion: Israel Institute of Technology, Haifa, Israel
155 Raymond and Beverly Sackler School of Physics and Astronomy, Tel Aviv University, Tel Aviv, Israel
156 Department of Physics, Aristotle University of Thessaloniki, Thessaloniki, Greece
157 International Center for Elementary Particle Physics and Department of Physics, The University of Tokyo, Tokyo, Japan
158 Graduate School of Science and Technology, Tokyo Metropolitan University, Tokyo, Japan
159 Department of Physics, Tokyo Institute of Technology, Tokyo, Japan
160 Tomsk State University, Tomsk, Russia
161 Department of Physics, University of Toronto, Toronto Ontario, Canada
162 INFN-TIFPA, Italy
163 University of Trento, Trento, Italy
164 TRIUMF, Vancouver British Columbia, Canada
165 Department of Physics and Astronomy, York University, Toronto Ontario, Canada
166 Faculty of Pure and Applied Sciences, and Center for Integrated Research in Fundamental Science and Engineering, University of Tsukuba, Tsukuba, Japan
167 Department of Physics and Astronomy, Tufts University, Medford Massachusetts, USA
168 Department of Physics and Astronomy, University of California Irvine, Irvine California, USA
169 INFN Gruppo Collegato di Udine, Sezione di Trieste, Udine, Italy
170 ICTP, Trieste, Italy
171 Dipartimento di Chimica, Fisica e Ambiente, Università di Udine, Udine, Italy
172 Department of Physics and Astronomy, University of Uppsala, Uppsala, Sweden
173 Department of Physics, University of Illinois, Urbana Illinois, USA
174 Instituto de Física Corpuscular (IFIC), Centro Mixto Universidad de Valencia - CSIC, Spain
175 Department of Physics, University of British Columbia, Vancouver British Columbia, Canada
176 Department of Physics and Astronomy, University of Victoria, Victoria British Columbia, Canada
177 Department of Physics, University of Warwick, Coventry, United Kingdom
178 Waseda University, Tokyo, Japan
179 Department of Particle Physics, The Weizmann Institute of Science, Rehovot, Israel
180 Department of Physics, University of Wisconsin, Madison Wisconsin, USA
181 Fakultät für Physik und Astronomie, Julius-Maximilians-Universität, Würzburg, Germany
182 Centre de Calcul de l’Institut National de Physique Nucléaire et de Physique des Particules (IN2P3), Villeurbanne, France
183 Academia Sinica Grid Computing, Institute of Physics, Academia Sinica, Taipei, Taiwan

\^a Deceased.
\^b Also at Institute of Physics, Azerbaijan Academy of Sciences, Baku, Azerbaijan.
\^c Also at Novosibirsk State University, Novosibirsk, Russia.
\^d Also at TRIUMF, Vancouver BC, Canada.
\^e Also at Department of Physics & Astronomy, University of Louisville, Louisville, KY, USA.
\^f Also at Physics Department, An-Najah National University, Nablus, Palestine.
\^g Also at Department of Physics, California State University, Fresno CA, USA.
\^h Also at Department of Physics, University of Fribourg, Fribourg, Switzerland.
\^i Also at II Physikalisches Institut, Georg-August-Universität, Göttingen, Germany.
\^j Also at Departament de Fisica de la Universitat Autonoma de Barcelona, Barcelona, Spain.
\^k Also at Departamento de Fisica e Astronomia, Faculdade de Ciencias, Universidade do Porto, Portugal.
\^l Also at Tomsk State University, Tomsk, and Moscow Institute of Physics and Technology State University, Dolgoprudny, Russia.
\^m Also at The Collaborative Innovation Center of Quantum Matter (CICQM), Beijing, China.
\^n Also at Universita di Napoli Parthenope, Napoli, Italy.
\^o Also at Institute of Particle Physics (IPP), Canada.
\^p Also at Horia Hulubei National Institute of Physics and Nuclear Engineering, Bucharest, Romania.
\^q Also at Department of Physics, St. Petersburg State Polytechnical University, St. Petersburg, Russia.
\^r Also at Borough of Manhattan Community College, City University of New York, New York City, USA.
\^s Also at Department of Financial and Management Engineering, University of the Aegean, Chios, Greece.
\^t Also at Centre for High Performance Computing, CSIR Campus, Rosebank, Cape Town, South Africa.
\^u Also at Louisiana Tech University, Ruston LA, USA.
