Contents

Preface ix

1 Introduction 1
  1.1 Sea bottom characterization ............................... 2
  1.2 Geoacoustic inversion ...................................... 3
    1.2.1 Research challenges ................................... 3
    1.2.2 Research questions .................................... 4
    1.2.3 Methodology ........................................... 4
  1.3 This thesis .................................................. 5
  1.4 Work not covered in this thesis ........................... 6

2 Operational context 9
  2.1 Introduction ................................................. 10
  2.2 Environmental information for naval warfare ............... 10
  2.3 Acoustic sensing in shallow water .......................... 12
  2.4 REA as a research project .................................. 13
  2.5 Discreet REA ................................................ 13
  2.6 Sound sources of opportunity ................................ 14
  2.7 Applications ............................................... 15
    2.7.1 Basic acoustic sensing ................................ 15
    2.7.2 Advanced acoustic sensing ............................. 16
    2.7.3 Assessment of buried waste ............................ 17
  2.8 Conclusions ................................................ 19

3 Acoustic inversion 21
  3.1 Introduction ............................................... 21
    3.1.1 Active and passive sonar ................................ 22
3.1.2 The environmental model ........................................ 23
3.2 Inverse acoustic sensing .......................................... 25
3.3 Sound sources of opportunity ................................... 26
3.4 Receiving sensors .................................................... 27
3.5 The medium .......................................................... 29
  3.5.1 Water column ...................................................... 29
  3.5.2 Sea bottom ....................................................... 30
  3.5.3 Ambient noise .................................................... 31
3.6 Forward propagation modeling .................................... 32
  3.6.1 Ray theory ....................................................... 32
  3.6.2 Normal mode theory .......................................... 33
  3.6.3 Parabolic equation models ................................... 33
  3.6.4 Criteria for model selection .................................. 33
  3.6.5 Available implementations ................................. 34
3.7 Objective functions ................................................. 35
  3.7.1 The Bartlett processor ....................................... 35
  3.7.2 Other processors .............................................. 37
3.8 Optimization .......................................................... 37
3.9 Inversion toolbox .................................................... 38
3.10 Conclusions ........................................................ 38

4 Geoacoustic inversion using a survey vessel as sound source 39
  4.1 Introduction .......................................................... 40
  4.2 Material and methods ............................................ 41
  4.3 The Saba bank ........................................................ 42
  4.4 Low frequency measurements and inversion .................... 44
    4.4.1 Geoacoustic inversion setup ............................... 45
    4.4.2 Objective function ........................................ 47
  4.5 Results and discussion ......................................... 47
  4.6 Summary and conclusions ....................................... 50

5 Geoacoustic inversion with an autonomous underwater vehicle 51
  5.1 Introduction ........................................................ 51
  5.2 Inversion with AUV self noise .................................. 52
  5.3 Concept of inversion with self noise .......................... 53
    5.3.1 Error function ............................................. 53
    5.3.2 Movement of the sound source ............................ 54
  5.4 AUV experiments ...................................................... 55
  5.5 Observations ........................................................ 55
    5.5.1 Water column and SVP .................................... 55
    5.5.2 Bottom: bathymetry and seismic profiling ............. 55
7.5 Results ................................................................. 88
  7.5.1 Tuning results ............................................... 89
  7.5.2 Run length distributions .............................. 92
7.6 Discussion .............................................................. 93
  7.6.1 Comparison .................................................. 93
  7.6.2 Uncertainty assessment ............................. 99
7.7 Conclusions ............................................................. 100

8 Conclusions ............................................................. 101
  8.1 Introduction .................................................... 101
  8.2 Conclusions ..................................................... 101
    8.2.1 Inversion with shipping sounds ....................... 102
    8.2.2 Reduction of data volume ............................ 102
    8.2.3 Uncertainty assessment ............................ 104
    8.2.4 Performance of metaheuristic optimizers ....... 104
  8.3 Applications and future research .................... 105

A Ambient Noise Curves ........................................ 107
B Sound speed equations (in water) ....................... 109
C Test functions for tuning .................................. 111

Bibliography .......................................................... 113

Acronyms ............................................................... 125

Summary ................................................................. 129

Samenvatting ........................................................... 131
